Local and regional management plans containing goals and objectives applicable to GHG emissions and overall climate change (listed in Appendix 7.1) provide only limited guidance in the assessment of Project-related effects on GHG emissions and overall climate change indicators. Most local and regional management plans have high-level goals of GHG emission reductions without setting explicit targets. The only exception is Nicola Valley's Official Community Plan, which spells out the objective to become carbon neutral. The Municipal Development Plan of the City of Edmonton describes a general framework for policies and initiatives on emission reductions, but it does not describe any specific targets, goals or objectives. Parkland County's Integrated Community Sustainability Plan mentions efforts and plans for energy conservation and GHG emissions reduction options but only within the scope of community operations.

Temporary GHG emissions (*e.g.*, from fossil fuel combustion in construction equipment or from forest clearing) are typically not considered in the context of local and regional management plans, nor do provincial GHG reporting requirements in BC and Alberta apply to temporary construction emissions. In addition, indirect emissions caused by electricity use for the pump assemblies are to be accounted for by the generating facility. Therefore, to avoid double counting, the Project's indirect emissions do not fall under local and regional management plans or provincial GHG reporting requirements in BC and Alberta. The Project's other sources of GHG emissions are negligible or so small that they are unlikely to be included in any local or regional inventory. Note that the only substantial source of GHG emissions is currently from vapour flaring of fugitive emissions at the Westridge Marine Terminal and that these emissions will be substantially reduced with the Project. Other management plans listed in Appendix 7.1 were reviewed and determined to have no specific goals or objectives related to the GHG emissions and overall climate change indicators.

The combined effects of the Project on GHG emissions and overall climate change are considered to be of low magnitude (Table 7.11.1-5, point 3[a]). A summary of the rationale for all of the significance criteria of combined effects of the Project on GHG emissions is provided below.

- Spatial Boundary: international – Project emissions of GHG disperse globally and overlap with global GHG emissions to cause cumulative international effects on climate change.
- Duration: long-term – Project emissions of GHG and their effects on climate change occur over a range of durations. GHG emissions related to construction of the pipeline, pump stations, (including power lines), installation of the storage tanks, and expansion of the Westridge Marine Terminal as well as operation of temporary facilities and pipeline reactivation activities are limited to the duration of the construction phase, and are therefore, short-term. Operation-related GHG emissions and the resulting climate change are expected to occur for the life of the operating pipeline and associated facilities and, therefore, are considered long-term.
- Frequency: continuous – the events resulting in GHG emissions and their potential effects on climate change occur over a range of frequencies. Emissions and climate change effects from construction of the pipeline, pump stations (including power lines), installation of the storage tanks, and expansion of the Westridge Marine Terminal as well as operation of temporary facilities and pipeline reactivation activities are limited to a specific period (*i.e.*, construction phase) and, therefore, are isolated. Operation-related GHG emissions and climate change effects from maintenance and inspection activities, building space heating and electricity use, and fugitive vapour combustion from vessel loading at the Westridge Marine Terminal are expected to occur periodically (intermittently but repeatedly) over the life of the operating pipeline and associated facilities. Finally, fugitive emissions, indirect GHG emissions from electricity use by pump assemblies and the associated potential climate change effects are expected to occur continuously over the life of the operating pipeline and associated facilities.

- Reversibility: permanent - emissions of GHG are assumed to cease within one year of decommissioning of the Project; however, effects on climate change will last past the life of the operating Project for hundreds to thousands of years and, therefore, are considered effectively permanent.
- Magnitude: low - Project emissions of GHG can be estimated and will be detectable. In the absence of environmental or regulatory emission limits for GHG emissions, the magnitude is rated as low. The resulting changes in environmental parameters (*e.g.*, increase in global average temperature), resulting from Project-related activities are not detectable from existing (baseline) climate variability.
- Probability: high - Project-related activities will result in emissions of GHG, and this is likely to contribute to an overall global climate change.
- Confidence: moderate - combined effects assessment is based on a good understanding of cause-effect relationships between the Project and GHG emissions; however, equipment-specific data are limited and, in some cases, obtained from outside the Project. With regards to climate change, determination of significance is based on a good understanding of cause-effect relationships between GHG emissions from Project activities and overall climate change. Observational and numerical modelling data also support the significance determination.

Summary

As identified in Table 7.11.1-5, there are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on GHG emissions of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the Project on GHG emissions indicators will be not significant.

TABLE 7.11.1-5

SIGNIFICANCE EVALUATION OF THE PROJECT ON GHG EMISSIONS

	Potential Effect	Impact Balance	Spatial Boundary	Temporal Context			Magnitude	Probability	Confidence	Significance[1]
				Duration	Frequency	Reversibility				
1.	GHG Emission Indicator – Emissions of CO_2, CH_4 and N_2O									
1(a)	Combined effects of the Project on the emissions of CO_2, CH_4 and N_2O indicator.	Negative	International	Short- to long-term	Isolated to continuous	Permanent	Low	High	Moderate	Not significant
2.	GHG Emission Indicator – Effects on Overall Climate Change									
2(a)	Combined effects of the Project on the effects on overall climate change indicator.	Negative	International	Short to long-term	Isolated to continuous	Permanent	Negligible	High	High	Not significant
3.	Combined Effects of the Project on GHG Emissions

Note: 1 Significant Residual Environmental Effect: A high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.6 Acoustic Environment

The evaluation of the effects of the Project on the acoustic environment indicators considers the combined effect of applicable Project components on each of the following physical environment indicators: sound levels; and vibration levels.

Combined Effects on the Sound Levels Indicator

The components of the Project which affect the sound levels indicator include the construction and operations of the proposed pipeline, temporary facilities, pump stations and storage tanks, Westridge Marine Terminal as well as pipeline reactivation. Residual effects varied between the construction and operations phases and were dependant on the type of activities. The significance of the combined effects on sound levels from construction and operations of the Project is summarized in Table 7.11.1-6.

The evaluation of the combined effects of the Project on the sound levels indicator considers collectively the assessment of the combined effects on this indicator from construction and operations of all Project components. Overall, the Project has the potential to cause sound level increases at residences during construction and operations which is considered to have a negative impact balance. Through implementation of industry standard recommended mitigation measures during the construction and operations phases of the Project, the combined effects of the Project on the sound levels indicator are considered to be of low to medium magnitude (Table 7.11.1-6, point 1[g]). A summary of the rationale for all of the significance criteria of combined effects on sound levels is provided below.

- Spatial Boundary: Acoustic Environment LSA – the combined effects of the Project on the sound levels indicator result in increases which comply with the AER *Directive 038* (ERCB 2007), BC OGC *Noise Control Best Practices Guideline* (BC OGC 2009) and Health Canada guidance within the Acoustic Environment LSA.
- Duration: short to long-term – the events causing the combined effects of the Project on the sound levels indicator will be short-term during the construction phase and in relation to pipeline operations. Pump stations, storage tanks and Westridge Marine Terminal all experience long-term changes in sound levels during the operations phase.
- Frequency: continuous – the combined effects of the Project on the sound levels indicator may be isolated to periodic for construction of the Project but will be continuous for pump station, tanks and Westridge Marine Terminal operations.
- Reversibility: long-term – the combined effects of the Project on the sound levels indicator considers operations at pump stations, storage tanks and the Westridge Marine Terminal which will extend over the life of the Project. All sound level changes are reversible as the sound will cease when the pipeline or facility is decommissioned.
- Magnitude: low to medium – with the implementation of appropriate mitigation measures during construction and at the pumps stations, noise levels at receptors are expected to comply with AER, BC OGC and Health Canada limits.
- Probability: high – the combined effects of the Project on the sound levels indicator are expected based on the proximity of residential receptors to Project activities.
- Confidence: moderate – based on the nature of the data inputs.

Combined Effects on the Vibration Indicator

The component of the Project which affects the vibration levels indicator is the pipeline. Vibration levels are affected by blasting of rock, which only occurs during the construction phase. No potential effects were identified for operations of the proposed pipeline nor for the construction or operations of temporary facilities, pump stations and storage tanks, or Westridge Marine Terminal. No potential effects were identified for vibration levels resulting from pipeline reactivation activities along the Hinton to Hargreaves Segment and Darfield to Black Pines Segment. Therefore, the significance of the combined effects on vibration levels reflect the construction of the pipeline only as described in Section 7.2.6.6 and is summarized in Table 7.11.1-6 (point 2[g]).

Combined Effects on the Acoustic Environment

All components of the Project affect the acoustic environment. These include the construction and operations of the proposed pipeline, temporary facilities, pump stations and storage tanks, as well as construction and operations activities associated with the Westridge Marine Terminal and pipeline reactivation. Residual effects from these activities varied between the construction and operations phases and were dependant on the type of activities. The significance of the combined effects on sound levels from construction and operations of the Project is summarized in Table 7.11.1-6.

Sound level limits from oil and gas related projects are regulated in Alberta under AER *Directive 038: Noise Control* (ERCB 2007). In BC, the BC OGC has issued the *Noise Control Best Practices Guideline* (2009) to be used for oil and gas development. No other legislation or bylaw requires a quantified sound level be met, except the City of Burnaby bylaw under specific conditions. Generally, noise bylaws indicate times for noisy activities such as construction and look to prevent annoyance, where they exist.

The evaluation of the combined effects of the Project on the acoustic environment considers collectively the assessment of the combined effects on the sound levels and vibration level indicators from construction and operations of all applicable Project components. Overall, the Project has the potential to cause sound level increases at residences during construction and operations which is considered to have a negative impact balance. Through implementation of industry standard recommended mitigation measures during the construction and operations phases of the Project, the combined effects of the Project on the acoustic environment indicators are considered to be of low to medium magnitude (Table 7.11.1-6, point 3[a]). A summary of the rationale for all of the significance criteria of combined effects of the Project on the acoustic environment indicators is provided below.

- Spatial Boundary: Acoustic Environment LSA – combined effects of the Project on the acoustic environment indicators result in increases which comply with the AER *Directive 038* (ERCB 2007), BC OGC *Noise Control Best Practices Guideline* (BC OGC 2009) and Health Canada guidance within the Acoustic Environment LSA. Vibration levels effects may extend into the Acoustic Environment RSA.
- Duration: short to long-term – the events causing combined effects on the acoustic environment will be short-term during the construction phase and in relation to pipeline operations. Pump stations, storage tanks and Westridge Marine Terminal all experience long-term changes in sound levels during the operations phase.
- Frequency: continuous – the combined effects of the Project on sound levels and vibration levels indicators may be isolated to periodic for construction of the Project but will be continuous for sound levels at pump stations, tanks and Westridge Marine Terminal operations.
- Reversibility: long-term – the combined effects of the Project on the acoustic environment consider operations at pump stations, tanks and Westridge Marine Terminal which will extend over the life of the Project. All sound level changes are reversible as the sound will cease when the pipeline or facility is decommissioned. Construction sound levels and vibration levels are reversible in the short-term.
- Magnitude: low to medium – with the implementation of appropriate mitigation measures during construction and at the pump stations, tanks and Westridge Marine Terminal during operations, noise levels at receptors are expected to comply with AER, BC OGC and Health Canada limits.
- Probability: high – combined effects of the Project on the acoustic environment are expected based on the proximity of residential receptors to Project activities.
- Confidence: moderate – based on the nature of the data inputs.

Summary

As identified in Table 7.11.1-6, there are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on the acoustic environment of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the Project on the acoustic environment indicators will be not significant.

2 Significant Residual Environmental Effect: A high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.7 Fish and Fish Habitat

The evaluation of the effects of the Project on fish and fish habitat considers the combined effect of applicable Project components on each of the following fish and fish habitat indicators: riparian habitat; instream habitat; fish mortality and injury; Arctic grayling; Athabasca rainbow trout; bull trout; burbot; northern pike; walleye; bull trout/Dolly Varden; Chinook salmon; coho salmon; cutthroat trout; and rainbow trout/steelhead.

Combined Effects of the Project on Fish and Fish Habitat Indicators

The evaluation of the combined effects of the Project on each of the 14 fish and fish habitat indicators are noted in Table 7.11.1-7. Table 7.2.7-3 and the accompanying discussion in Section 7.2.7.6 provide an evaluation of significance of the combined effects of the Project on these indicators.

Combined Effects of the Project on Fish and Fish Habitat

The evaluation of the combined effects of the Project on the fish and fish habitat indicators considers collectively the assessment of the combined effects of the Project on the following fish and fish habitat indicators: riparian habitat; instream habitat; fish mortality or injury; Arctic grayling; Athabasca rainbow trout; bull trout; burbot; northern pike; walleye; bull trout/Dolly Varden; Chinook salmon; coho salmon; cutthroat trout; and rainbow trout/steelhead. Project components contributing to combined effects include the construction and operations of the pipeline, temporary facilities (specifically temporary access roads), pump stations (including power lines), storage tanks (through hydrostatic testing) and pipeline reactivation activities (through hydrostatic testing). No interactions between fish and fish habitat and the Westridge Marine Terminal were predicted.

Local and regional management plans containing goals and objectives applicable to fish and fish habitat aid in the assessment of Project-related effects on fish and fish habitat and influenced the mitigation developed to reduce or avoid adverse effects. For example, through the implementation of the mitigation measures for each fish and fish habitat indicator, it is believed that the Project meets the goals of the plans and strategies for fish and fish habitat within the Aquatics RSA. These relate to the protection of fish and fish habitat, restoring or maintaining populations and maintaining diversity, for particular species (Alberta Lake Sturgeon Recovery Team 2011, ASRD 2012, Berry 1998, Berry 1999, Berry 1995, Pearson *et al.* 2008, National Recovery Team for Cultus Pygmy Sculpin 2007), some of which apply to indicator species and are discussed in Section 7.2.7-6. In addition, some local and regional management plans had general goals and objectives related to fish and fish habitat as a whole (Appendix 7.1). Mitigation measures to reduce effects on fish and fish habitat are provided in the Pipeline EPP and Facilities EPP and include the selection of appropriate pipeline and vehicle crossing methods, adherence to least risk work windows, implementation of erosion controls and reclamation and access control measures. With the successful implementation of the mitigation measures and since Project activities will be conducted in accordance with all applicable federal and provincial legislation, the Project is not expected to interfere with goals and objectives of the various management plans as they relate to fish and fish habitat.

The combined effects of the Project on fish and fish habitat are considered to be of medium to long-term reversibility and low to medium magnitude (Table 7.11.1-7, point 15[a]). A summary of the rationale for all of the significance criteria of combined effects on the fish and fish habitat indicators is provided below.

- Spatial Boundary: Aquatics RSA – the combined effects of the Project on the fish and fish habitat indicators will extend beyond the Fish and Fish Habitat LSA.
- Duration: immediate to short-term – most events causing combined effects on the fish and fish habitat indicators are attributed to instream watercourse activities (*e.g.,* increase in suspended sediment) or the construction phase of various Project components (*e.g.,* clearing of riparian habitat for the pipeline, hydrostatic testing of tanks and pipeline reactivation).
- Frequency: isolated – most of the Project activities contributing to combined effects on the fish and fish habitat indicators occur during the construction phase although it is acknowledged that maintenance activities during the operations phase also contribute to combined effects.
- Reversibility: medium to long-term – combined effects of the Project on the fish and fish habitat indicators with respect to instream habitat and fish mortality and injury at pipeline and temporary vehicle crossings are typically reversible in the medium-term while effects from riparian habitat associated with the pipeline, temporary access roads and power lines, are reversible in the medium to long-term depending on the pre-existing vegetative community (*e.g.,* shrubs or trees).
- Magnitude: low to medium – combined effects of the Project on the fish and fish habitat indicators are generally considered to be of low magnitude given the implementation of mitigation measures reflective of industry standards and federal and provincial guidelines and that the Project is not expected to interfere with goals and objectives of the various management plans as they relate to fish and fish habitat. However, for instream construction activities at large flowing watercourses where suspended sediment concentrations could contribute to a HADD and fish mortality or injury, regulatory authorization will be obtained, reducing the magnitude to medium.

- Probability: high – various Project components are predicted to affect one or more fish and fish habitat indicators.
- Confidence: moderate – based on the professional experience of the assessment team.

<u>Summary</u>

There are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on fish and fish habitat of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the Project on fish and fish habitat indicators will be not significant.

Notes: 1 RSA = Aquatics RSA.

2 Significant Residual Environmental Effect: A high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.8 Wetland Loss or Alteration

The evaluation of the effects of the Project on wetlands considers the combined effect of applicable Project components on the wetland loss or alteration indicator: wetland function.

Combined Effects of the Project on Wetland Loss or Alteration

The components of the Project which may affect the wetland loss or alteration indicator (*i.e.,* wetland function) include the proposed pipeline, temporary facilities and pump stations (and associated power lines). No potential effects on wetland function are anticipated from the pipeline reactivation activities and the construction and operations activities related to the tanks and the Westridge Marine Terminal. The evaluation of the combined effects of the Project on wetland loss or alteration considers collectively the assessment of the combined effects of the applicable Project components on the following wetland loss or alteration indicator: wetland function (*i.e.,* habitat, hydrological and biogeochemical).

Through the implementation of the mitigation measures for the wetland loss or alteration indicator, it is believed that the Project meets the wetland function-related objectives of the Federal Policy on Wetland Conservation (FPWC) and the following management plans:

- Strathcona Municipal Development Plan (Strathcona County 2007);
- City of Edmonton Municipal Development Plan (City of Edmonton 2010);
- Spruce Grove Municipal Development Plan (City of Spruce Grove 2010);
- Regional District of Fraser-Fort George Official Community Plans (Regional District of Fraser-Fort George 2013);

- Hope Official Community Plan Bylaw No. 1147 (District of Hope 2004);
- Fraser Valley Regional District Community Plan Electoral Area B (Fraser Valley Regional District 1998); and
- Fraser Valley Regional District Community Plan Electoral Area D (Fraser Valley Regional District 1997).

With the successful implementation of the mitigation measures and since the Project activities will be conducted in accordance with all applicable federal, provincial and municipal legislation, the Project is not expected to interfere with goals and objectives of the various management plans relevant to wetland function. For example, where feasible, Trans Mountain has met the intent of the FPWC (National Wetland Working Group 1997) by managing potential effects on wetlands (*e.g.,* loss of wetland function) by implementing a routing decision framework that takes into consideration aligning the route along an adjacent existing pipeline corridor, reducing length within environmentally sensitive areas, developing construction and reclamation mitigation measures to ensure wetland function in maintained and monitoring wetland function post-construction. Post-construction environmental monitoring of wetland function conducted for past pipeline construction projects (TERA 2011b,c,e, 2012b,c,d) have successively documented the reduction in severity of disturbance to wetland function. These previous projects have shown that mitigation measures implemented during construction can be successful and that wetlands have proven to be resilient.

However, if it becomes apparent following post-construction environmental monitoring that wetland function has not been effectively maintained and if additional remediation to restore wetland function is determined not to be an appropriate course of action following consultation with federal and provincial regulatory authorities, then compensation may be discussed with Environment Canada. This measure will ensure that the overall goal of “no net loss” of wetland function, as outlined in the FPWC, is achieved for the Project.

By aligning the proposed pipeline corridor to travel through a existing transportation utility corridor where feasible and by developing and implementing mitigation measures to reduce the Project-related effects on wetland function, it is estimated that the Project meets the goals of the Strathcona County, City of Edmonton and City of Spruce Grove Municipal Development Plans (City of Edmonton 2010, City of Spruce Grove 2010, Strathcona County 2007), as well as the meeting the requirements of federal (*e.g.,* Environment Canada) and provincial regulatory authorities (*e.g.,* BC OGC, BC MOE and AESRD). Through the implementation of specific mitigation measures to reduce the disturbance to wetlands through the maintenance of riparian vegetation, narrowing the width of the construction right-of-way and with appropriate approvals in place, the Project aligns with the Regional District of Fraser-Fort George, District of Hope and the Fraser Valley Regional District Official Community Plans (District of Hope 2004, Fraser Valley Regional District 1997, Fraser Valley Regional District 1998, Regional District of Fraser-Fort George 2013).

The combined effects of the Project on the wetland loss or alteration indicator are of low magnitude which is based in part on the limited areal extent where the effects would occur (Table 7.11.1-8, point 1[g]). A summary of the rationale for all of the significance criteria of combined effects of the Project on wetland element is provided below.

- Spatial Boundary: Wetland LSA – combined effects of the Project on wetlands with respect to loss or alteration of wetland function (*i.e.,* habitat, hydrological and biogeochemical) may extend beyond the Footprint of the applicable Project components.
- Duration: short-term – the events causing combined effects of the Project on wetlands are construction of the pipeline, temporary facilities, pump stations (including power lines) and maintenance activities which will be completed within any one year during the operations phase (*i.e.,* short-term).
- Frequency: isolated to periodic – the events contributing to combined effects on wetlands include those causing alteration of wetland function (*i.e.,* construction of the proposed pipeline corridor, temporary facilities and maintenance activities) which occur intermittently but repeatedly over the

assessment period whereas events causing loss of wetland function (*i.e.,* partial infilling of wetlands due to construction of the proposed power line structures) are confined to a specified phase of the assessment period (*i.e.,* construction).

- Reversibility: medium to long-term – loss or alteration of wetland function depends on the growth of wetland species (medium-term) found along the proposed pipeline corridor and within the potential restoration/enhancement site, the time required to restore pre-construction elevation and contours (medium-term) and the time for biogeochemical processes to be restored or created along the proposed pipeline corridor or in the potential restoration/enhancement site (medium to long-term). The reversibility of the combined effect of the Project on the wetland loss or alteration element may take longer than one year with the possibility of being greater than 10 years.
- Magnitude: low – based on the proposed mitigation measures (*i.e.,* substrate being restored to pre-construction profile and allowing natural regeneration in wetlands) and the post-construction literature that demonstrates that wetlands are resilient provided habitat function is not permanently altered. Also, with meeting the goals and objectives of applicable management plans and with the potential implementation of compensation, if required, there will be “no net loss” of wetlands (for all effects).
- Probability: high – the proposed pipeline corridor and temporary facilities as well as the proposed Kingsvale power line encounter a number of wetlands, and disturbances within these wetlands will likely occur during pipeline construction and site-specific maintenance activities as well as during construction activities along the power line.
- Confidence: high – based on available research literature, results of mitigation measures and post-construction environmental monitoring programs of past pipeline projects and the professional experience of the assessment team.

Summary

As identified in Table 7.11.1-8, there are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on wetland loss or alteration of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the Project on the wetland loss or alteration indicators will be not significant.

TABLE 7.11.1-8

SIGNIFICANCE EVALUATION OF THE PROJECT ON WETLAND LOSS OR ALTERATION

	Potential Effect	Impact Balance	Spatial Boundary[1]	Temporal Context			Magnitude	Probability	Confidence	Significance[2]

2 <u>Significant Residual Environmental Effect</u>: A high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.9 Vegetation

The evaluation of the effects of the Project on vegetation considers the combined effect of applicable Project components on the vegetation indicators: vegetation communities of concern; plant and lichen species of concern; and presence of infestations of Provincial weed species and other invasive non-native species identified as a concern.

Combined Effects of the Project on Vegetation Communities of Concern

The components of the Project which affect vegetation communities of concern include the construction and operations of the proposed pipeline, temporary facilities, pump stations and storage tanks, as well as pipeline reactivation activities. No potential effects were identified for vegetation communities of concern resulting from construction and operations activities at the Westridge Marine Terminal. The significance of the combined effects of the Project on the vegetation communities of concern indicator from each of these components is summarized in Table 7.11.1-9.

The evaluation of the combined effects of the Project on vegetation communities of concern considers collectively the effects from construction and operations of all applicable Project components. Overall, the Project has the potential to alter vegetation communities of concern, including grasslands in the BG BGC Zone and rare ecological communities, which is considered to have a negative impact balance. The proposed pipeline corridor was routed along existing rights-of-way and other linear disturbance to the extent practical. Based on TEM mapping, approximately 2,231 ha of native vegetation may be disturbed or altered during construction and operations of the proposed pipeline, pump stations (including power lines) and storage tanks.

Key mitigation measures to reduce combined effects on vegetation communities of concern are highlighted below.

- Site-specific mitigation will include avoidance, narrowing the construction right-of-way, fencing or protecting.
- Conduct a pre-construction weed survey and record problem vegetation (designated weeds) infestations on and immediately adjacent to the construction right-of-way.
- Consider delaying clearing to allow seed set and to limit drying of the soils.
- Mow or walk down rather than wholly remove shrubs, where feasible.
- Conduct straw crimping on disturbed agricultural or native grassland soils where wind erosion may be problematic.
- Disturbed areas through native vegetation segments will be allowed to naturally regenerate or will be seeded with the appropriate native seed mix.
- Manage all problem vegetation along the construction right-of-way during all pipeline construction phases (*i.e.,* pre-construction, construction, post-construction environmental monitoring) and the operational phase.
- Monitor the effectiveness of revegetation efforts during the post-construction environmental monitoring of the construction rights-of-way. Conduct additional remedial work, where warranted.

By preserving native vegetation using the mitigation highlighted above, highlighted in Table 7.2.9-3 and the EPPs of Volume 6B and 6C, the Project will achieve the objectives of the land use plans for the areas traversed by the proposed corridor. Objectives of the management plans include maintaining natural vegetation throughout the development process, preserving natural vegetation including trees to the extent feasible in all undeveloped and riparian areas and discouraging further clearing or development in areas where native vegetation is important for soil conservation, water resources protection or wildlife habitat (City of Kamloops 2004, Strathcona County 2007, TNRD 2000, TNRD 2011a-e, Town of Edson 2006, Yellowhead County 2005, Yellowhead County 2006, Yellowhead County 2007). See Appendix 7.1 for more details of the land use plan objectives related to vegetation.

Through implementation of best practices, objectives and provincial guidelines during the construction and operations phases of the Project, the combined effects of the Project on vegetation communities of concern are considered to be of low to medium magnitude (Table 7.11.1-9, point 1[g]). In addition, effects on vegetation communities of concern will be monitored as part of the post-construction environmental monitoring program (Volume 6A). A summary of the rationale for all of the significance criteria of combined effects of the Project on vegetation communities of concern is provided below.

- Spatial Boundary: Vegetation LSA – alteration of vegetation communities of concern may extend beyond the Footprint associated with each Project component.
- Duration: short-term – the events causing combined effects on the vegetation communities of concern indicator are the construction of the various Project components and maintenance activities which will be completed within any one year during the operations phase.
- Frequency: periodic - the events causing the combined effects on the vegetation communities of concern indicator are generally confined to the construction phase but may occur intermittently but repeatedly (*e.g.,* maintenance activities) during the operations phase.
- Reversibility: medium to long-term – combined effects of the Project on the vegetation communities indicator depends on the communities being disturbed by Project components and the time required to restore pre-construction conditions of vegetation, hydrology and light levels (medium [for pipeline or power line construction] to long-term [in the case of pump stations or terminals]). The reversibility of the residual effect may take longer than one year with the possibility of being greater than 10 years (in the case of facilities or mature treed areas [*i.e.,* treed fens]).
- Magnitude: low to medium – based on the proposed mitigation measures (*i.e.,* allowing natural regeneration in native vegetation areas, revegetating with an appropriate native seed mix, implementing a Reclamation Management Plan or applying appropriate migration to protect rare ecological communities as per the Rare Ecological Community and Rare Plant Population Management Plan) and the post-construction environmental monitoring literature that demonstrates that vegetation communities are resilient. Combined effects on vegetation communities of concern are anticipated to be largely mitigated during construction.
- Probability: high – the Project components will collectively disturb vegetation communities of concern.
- Confidence: moderate – based on available research literature, results of mitigation measures and post-construction environmental monitoring programs of past pipeline projects and the professional experience of the assessment team.

Combined Effects of the Project on Plant and Lichen Species of Concern

The components of the Project which affect plant and lichen species of concern include the construction and operations of the proposed pipeline, pump stations and storage tanks, as well as pipeline reactivation activities. No potential effects were identified for plant and lichen species of concern resulting from construction and operations of temporary facilities or activities at the Westridge Marine Terminal. The significance of the combined effects of the Project on the plant and lichen species of concern indicator from each of these components is summarized in Table 7.11.1-9.

The evaluation of the combined effects of the Project on plant and lichen species of concern considers collectively the effects from construction and operations of all applicable Project components. Overall, the Project has the potential to alter plant and lichen species of concern through direct disturbance or indirectly through changes in hydrology or light levels, which is considered to have a negative impact balance.

Mitigation measures for rare plant and lichen species generally fall into categories of avoidance, (*e.g.,* realignment, change of work side, narrowing), reducing disturbance (*e.g.,* narrowing, adjusting workspaces, protective matting, snow cover in the winter) and alternative construction/reclamation techniques (*e.g.,* salvaging seed or sod, relocation of substrates, plant propagation, plant or lichen transplanting, separate strippings salvage, delay clearing, access management) (see the Vegetation

Technical Report of Volume 5C for more details). Refer to the Rare Ecological Community and Rare Plant Population Management Plan in the EPPs of Volume 6B and 6C for additional measures. These proposed mitigation measures have been used previously on other major pipeline construction projects with good success.

Through implementation of best practices, objectives and provincial guidelines during the construction and operations phases of the Project, the combined effects of the Project on the plant and lichen species of concern indicator are considered to be of medium magnitude (Table 7.11.1-9, point 2[g]). A summary of the rationale for all of the significance criteria of combined effects of the Project on the plant and lichen species of concern indicator is provided below.

- Spatial Boundary: Vegetation LSA – although combined effects of the Project on rare plant and lichen species of concern are generally confined to the disturbed portion of the construction right-of-way, potential changes in hydrology, dust and light levels may extend beyond the Footprint associated with each Project component.
- Duration: short-term – the events causing combined effects on the plant and lichen species of concern indicator are the construction of the various Project components and maintenance activities which will be completed within any one year during the operations phase.
- Frequency: periodic – the events causing the combined effects on the plant and lichen species of concern indicator are generally confined to the construction phase but may occur intermittently but repeatedly (*e.g.,* maintenance activities) during the operations phase.
- Reversibility: medium to long-term – combined effects of the Project on the plant and lichen species of concern indicator depends on the species and their habitats that occur on the Footprint of the Project component (*e.g.,* annual vs. perennial) and the time required to restore pre-construction conditions of vegetation, hydrology and light levels. The reversibility of the residual effect may take more than one year plus adequate precipitation levels in order for natural drainage patterns to be restored, and it will take years for vegetation to grow back to former heights, which is what affects the light levels reaching surrounding vegetation communities.
- Magnitude: medium – combined effects of the Project on plant and lichen species of concern are anticipated to be mitigated during construction. Mitigation for species of concern is selected from a suite of proven and successful mitigation strategies to ensure the local population will not be placed at risk. Post-construction environmental monitoring will be conducted following construction to monitor the success of the applied mitigation measures.
- Probability: high – Project components are likely to encounter plant and lichen species of concern.
- Confidence: moderate – based on available research literature, results of field surveys, post-construction environmental monitoring programs of past pipeline projects and the professional experience of the assessment team.

Combined Effects of the Project on Presence of Infestations of Provincial Weed Species and Other Invasive Non-Native Species Identified as a Concern

The components of the Project which affect weeds and other invasive non-native species include the construction and operations of the proposed pipeline, temporary facilities, pump stations, storage tanks, and Westridge Marine Terminal as well as pipeline reactivation activities. The significance of the combined effects on weeds and other invasive non-native species from each of these components is summarized in Table 7.11.1-9.

The evaluation of the combined effects of the Project on weeds and other invasive non-native species considers collectively the effects from construction and operations of all Project components. Overall, the Project has the potential to increase infestations of weeds and other invasive non-native species, which is considered to have a negative impact balance.

Mitigation measures outlined in Table 7.2.9-3 and in the EPPs of Volume 6B and 6C are effective industry standard measures to reduce the potential for the introduction and spread of weeds. These measures will be implemented during both construction and maintenance of the Project.

Experience during past construction programs has shown that, while weed infestations were encountered, the implementation of appropriate mitigation measures during construction resulted in limited weed issues (Alliance Pipeline 2002, Inter Pipeline 1995, Enbridge Pipelines Inc 2000, 2002, TERA 2012). In addition, the final post-construction environmental monitoring report for the TMX Anchor Loop Project indicated that after 5 years, the post-construction vegetation management program had effectively controlled or suppressed non-native invasive broadleaf species of concern, identified during the pre-construction survey, along the right-of-way (TERA 2013).

Key mitigation measures to reduce the introduction and spread of weeds includes: conducting a pre-construction weed survey; cleaning equipment (*i.e.,* shovel and sweep, pressurized water or compressed air) involved in topsoil/root zone material handling at weed-infested sites prior to leaving the location; using only Certified Canada No. 1 or the best available agronomic seed and for native seed, obtaining the highest seed grade available; implementing the Weed and Vegetation Management Plan; using herbicides for problem vegetation management along the construction right-of-way during construction and operations; and monitoring the effectiveness of revegetation efforts during the post-construction environmental monitoring of the construction rights-of-way.

Through implementation of industry standard and provincially recommended mitigation measures during the construction and operations phases of the Project, the combined effects of the Project on weeds and other invasive non-native species are considered to be of low to medium magnitude (Table 7.11.1-9, point 3[g]). A summary of the rationale for all of the significance criteria of combined effects of the Project on weed species and other invasive non-native species identified as a concern is provided below.

- Spatial Boundary: Vegetation RSA – combined effects of the Project on the weeds and other invasive non-native species indicator may extend past the Footprint and Vegetation LSA into the Vegetation RSA.
- Duration: short-term – the events causing combined effects on the weeds and other invasive non-native species indicator are the construction of various Project components and maintenance activities which will be completed within any one year during the operations phase.
- Frequency: periodic – the events causing the combined effects on the weed and other invasive non-native species indicator are generally confined to the construction phase, and may occur intermittently but repeatedly over operations phase (*e.g.,* herbicide control).
- Reversibility: short to medium-term – the reversibility of the combined effects of the Project depends on the weed species, the size/location of the weed occurrence, the associated land use and mitigation monitoring. Project effects may take longer than one year to reverse, but will be addressed during post-construction environmental monitoring.
- Magnitude: low to medium – combined effects of the Project on the weed and invasive non-native species indicator are anticipated to be largely mitigated during construction and post-construction environmental monitoring.
- Probability: high – pipeline and facility construction is expected to cause some weed introduction and spread.
- Confidence: high – based on available research literature, results of field surveys, post-construction environmental monitoring programs of past pipeline projects and the professional experience of the assessment team.

Combined Effects of the Project on Vegetation

The evaluation of the combined effects of the Project on the vegetation indicators considers collectively the effects of the Project on the following vegetation indicators: vegetation communities of concern; plant and lichen species of concern; and presence of infestations of Provincial weed species and other invasive non-native species identified as a concern.

Local and regional management plans containing goals and objectives applicable to vegetation have aided in the assessment of Project-related effects on the vegetation indicators and influenced the mitigation developed to reduce or avoid adverse effects. In addition, through the implementation of the mitigation measures for each vegetation indicator, it is believed that the Project meets the goals of both the Official Community Plan (City of Surrey 1996) to discourage clearing of trees and vegetation, and the Strathcona County Municipal Development Plan (Strathcona County 2007) to discourage further clearing or development in areas where native vegetation is important for soil conservation, water resources protection or wildlife habitat. For example, mitigation measures to reduce clearing of native vegetation include maintaining a low growing vegetation cover within the riparian zone around watercourses and wetlands. Through implementation of mitigation measures and post-construction environmental monitoring, the Project also aligns with the policies of the City of Coquitlam Citywide Official Community Plan (City of Coquitlam 2001a) to use appropriate native vegetation in areas to be replanted, as well as the policies of the Way We Grow: Municipal Development Plan (City of Edmonton 2010) to restore ecologically degraded and/or damaged ecological systems and linkages to protect, expand and enhance biodiversity. Mitigation measures developed for protection of grassland vegetation communities, including minimizing the trench width on native grasslands where possible and conducting native seed collection for use in revegetation efforts, achieves the objectives of the KAMPLAN – Official Community Plan (City of Kamloops 2004), which includes maintaining natural vegetation and protecting grasslands.

Additional goals and objectives contained in the various local and regional management plans relevant to vegetation are listed in Appendix 7.1. Other management plans listed in Appendix 7.1 were reviewed and determined to have no specific goals or objectives related to the vegetation indicators. With the successful implementation of the mitigation measures, and since Project activities will be conducted in accordance with all applicable provincial and municipal legislation, the Project is not expected to interfere with goals and objectives of the various management plans relevant to vegetation as listed in Appendix 7.1.

The combined effects of the Project on the vegetation indicators are considered to have a negative impact balance. Through implementation of industry standard and provincially recommended mitigation measures during the construction and operations phases of the Project, the combined effects of the Project on the vegetation indicators are considered to be of low to medium magnitude (Table 7.11.1-9, point 4[a]). In addition, combined effects on vegetation will be monitored as part of the post-construction environmental monitoring program (Volume 6A). A summary of the rationale for all of the significance criteria of combined effects of the Project on the vegetation indicators is provided below.

- Spatial Boundary: Vegetation RSA – combined effects of the Project on the vegetation indicators may extend beyond the construction or operations workspace to the Vegetation RSA.
- Duration: short-term – the events causing the combined effects of the Project on the vegetation indicators are the construction of various Project components and maintenance activities which will be completed within any one year during the operations phase.
- Frequency: periodic – the events causing the combined effects of the Project on the vegetation indicators are generally confined to the construction period but some may occur intermittently but repeatedly during the operations phase.
- Reversibility: medium to long-term – combined effects of the Project on the vegetation indicators may be reversible in the medium-term for some vegetation communities of concern, rare plant and lichen species of concern and invasive weed areas associated with the Project, and long-term (*i.e.,* greater than 10 years) for specific sites associated with Project components where native vegetation will not be fully restored until decommissioning and abandonment (*e.g.,* areas where mature treed areas were cleared for construction and mowed during operations).
- Magnitude: low to medium – combined effects of the Project on the vegetation indicators are anticipated to be largely mitigated during construction and post-construction environmental

monitoring. The Project is not expected to interfere with goals and objectives of various management plans relevant to vegetation.

- Probability: high – based on data pertinent to the Project area and the professional experience of the assessment team.
- Confidence: high – based on data pertinent to the Project area and the professional experience of the assessment team.

Summary

As identified in Table 7.11.1-9, there are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on vegetation of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the Project on vegetation indicators will be not significant.

2 Significant Residual Environmental Effect: A high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.10 Marine Sediment and Water Quality

The evaluation of the effects of the Project on marine sediment and water quality considered the combined effects of applicable Project components (*i.e.,* construction and operations of the Westridge Marine Terminal) on the marine sediment and water quality indicators: marine sediment quality and marine water quality.

The evaluation of the combined effects of the Project on each of the above marine sediment and water quality indicators noted in Table 7.11.1-10 (points 1[g] and 2[g]) reflect the construction and operations of the Westridge Marine Terminal since this is the only Project component affected. Table 7.6.8-3 and the accompanying discussion in Section 7.6.8.6 provide an evaluation of significance of the combined effects on these indicators.

Combined Effects of the Project on Marine Sediment and Water Quality

The combined effects of construction and operations of the Westridge Marine Terminal on marine sediment and water quality are associated with dredging during construction and with release of treated stormwater during operations (Table 7.11.1-10, point 3[a]). Release of TSS and existing contaminants from sediment during dredging (should dredging occur) will be limited. TSS levels will be managed through use of a clamshell dredge and turbidity curtains to limit the amount and spatial extent of TSS generated and to meet water quality guidelines outside of the immediate dredge area. Contaminant concentrations are similar throughout the Marine Sediment and Water Quality LSA (and meet screening criteria for disposal at sea for PAHs and PCBs, but are above the screening levels for some metals) and mitigation measures will be used to reduce the amount of sediment released and dispersed. Release of petroleum hydrocarbons in stormwater during operations will be controlled through the use of an oil/water separator, which is well understood technology, and concentrations will meet provincial permit requirements for an effluent discharge; there will be no change compared to the existing conditions.

There is no specific local or regional management plan with goals and objectives applicable to marine sediment and water quality to aid in the assessment of Project-related effects on the marine sediment and water quality and quantity indicators. There are, however, specific regulatory requirements for TSS management and disposal of dredged sediment during construction and discharge of stormwater during operations. By meeting permit requirements (as is the case currently) and implementing the mitigation measures for each sediment and water quality indicator, it is believed that the Project will support the objectives described in the "Ambient water quality objectives for Burrard Inlet Coquitlam-Pitt River area" (Nijman 1990).

A summary of the rationale for all of the significance criteria of combined effects of the Project on the marine sediment and water quality indicators is provided below (Table 7.11.1-10, point 3[a]), assuming the largest effect criteria predicted for either sediment or water.

- Spatial Boundary: Marine Sediment and Water Quality LSA – rapid dilution of treated stormwater within a short distance of the outfall, given that the outfall is located in the LSA (sediment disturbance would be limited to the Footprint).
- Duration: long-term – stormwater discharges will occur throughout the operations phase (construction effects would be short-term).
- Frequency: periodic – effluent release will occur intermittently but repeatedly over the assessment period during rainfall events (construction effects will be isolated, confined to the dredging period).
- Reversibility: short-term – each stormwater event is reversible soon after the discharge stops; however, the overall effect of stormwater discharge will not stop until the end of operations (the construction effects are reversible in the short-term).
- Magnitude: low – site runoff will be within permit requirements, which are set to protect marine aquatic biota; for both construction and operations, the expansion of Westridge Marine Terminal facilities will not result in quantifiable changes in measurable parameters as there will be no change from existing conditions.
- Probability: high – given the rainfall regime in the Project area and the dredging activity, should it occur.
- Confidence: high – for construction and operations, there is a good understanding of the cause-effect relationships between contaminant conditions and potential for adverse effects on marine life, effectiveness of mitigation measures, and site-specific data upon which to base the assessment.

Summary

As identified in Table 7.11.1-10, there are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on marine sediment and water quality of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the Project on marine sediment and water quality indicators will be not significant.

2 Significant Residual Environmental Effect: A high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.11 Marine Fish and Fish Habitat

The evaluation of the effects of the Project on marine fish and fish habitat considered the combined effects of applicable Project components (*i.e.,* construction and operations of the Westridge Marine Terminal) on the marine fish and fish habitat indicators: marine riparian habitat; intertidal habitat; subtidal habitat; Dungeness crab; inshore rockfish; and Pacific salmon.

The evaluation of the combined effects of the Project on each of the above marine fish and fish habitat indicators noted in Table 7.11.1-11 (points 1[g], 2[g], 3[g], 4[g], 5[g] and 6[g]) reflect the construction and operations of the Westridge Marine Terminal since this is the only Project component affected. Table 7.6.9-3 and the accompanying discussion in Section 7.6.9.6 provide an evaluation of significance of the combined effects on these indicators.

Combined Effects of the Project on Marine Fish and Fish Habitat

Construction of the Westridge Marine Terminal will result in the loss of marine riparian vegetation, intertidal habitat and subtidal habitat within the Footprint. The existing marine riparian habitat is a narrow fringe of small shrubs, brambles and herbaceous plants, and likely provides little value to marine fish. The intertidal habitat is mostly anthropogenic (rip rap), which was created during construction of the original Westridge Marine Terminal in the mid-1950s. Shoreline infilling will extend the shoreline seaward and will effectively replace the existing intertidal habitat like-for-like (*i.e.,* rip rap with rip rap). Subtidal habitats lost due to infilling and pile installation are primarily soft sediment (sand and mud), although a small area of subtidal rip rap near the shoreline will also be covered during the placement of fill material. The loss of marine fish habitat will be partially offset by the creation of rocky intertidal and subtidal habitat along the outer face of the fill slope. Though anthropogenic in nature, this habitat is expected to be colonized by a suite of marine organisms similar to those currently inhabiting the existing rocky habitats within the Marine Fish and Fish Habitat LSA.

The loss of marine riparian, intertidal and subtidal habitats will result in a temporary reduction of the productive capacity of marine fish habitats within the Marine Fish and Fish Habitat LSA. This effect will be offset through the implementation of a marine fish habitat compensation program, which will ensure there is no net loss of productive capacity. The specific compensation measures to be implemented will be developed in consultation with DFO, Aboriginal communities, and other interested parties during the permitting phase of the Project. One potential option is the construction of a subtidal rock reef near the Westridge Marine Terminal, which would provide high-value, structurally complex habitat for a variety of harvested fish and invertebrates, including Pacific salmon, inshore rockfish and Dungeness crabs. The reef would be colonized by a diverse assemblage of algae and sedentary invertebrates, which would provide prey for fish and mobile invertebrates. Colonization of the reef would begin immediately after construction, and full establishment of a functional community would be expected to take 2 to 3 years.

Shoreline infilling and dredging will result in the mortality of sessile and slow-moving invertebrates within the Footprint, while fish and more mobile invertebrates are expected to avoid harm by dispersing away from the work area. To minimize the number of Dungeness crabs injured or killed, a crab salvage program will be conducted immediately prior to any infilling or dredging works. Crabs will be collected with baited traps and relocated to suitable habitats outside of the Marine Fish and Fish Habitat LSA. To minimize the potential injury or mortality of finfish, including Pacific salmon and inshore rockfish, infilling and dredging works will be conducted during the DFO least risk timing window for Burrard Inlet – August 16 to February 28. If this becomes impractical, timing will be determined in consultation with DFO. Loud underwater noise produced during pile driving may also result in the injury or mortality of a small number of Pacific salmon and inshore rockfish. To minimize this potential effect, a vibratory method of pile installation, which produces substantially lower underwater noise levels, will be used wherever possible. If an impact hammer method is required, bubble curtains will be installed around the full wetted length of the pile in order to reduce the noise levels to the extent practicable. With these mitigation measures, injury or mortality to marine fish is considered unlikely. The combined Project effects on marine fish and fish habitat resulting from construction of the Westridge Marine Terminal are considered to have a negative impact balance. While the habitat losses associated with construction will be permanent, implementation of a marine fish habitat compensation program will ensure there is no net loss of productive capacity. The objective of the compensation program will be to increase the productive capacity of fish habitats in Burrard Inlet through the creation of high-value habitats with direct benefits to a variety of ecologically, economically and culturally important species. The injury or mortality of a small number of fish and invertebrates during construction will not affect the viability of any local or regional populations. With the implementation of mitigation measures described in Section 7.6.9, combined Project effects on marine fish and fish habitat are predicted to be low in magnitude (Table 7.11.1-11, point 7[a]). A summary of the rationale for all of the significance criteria of combined effects of the Project on the marine fish and fish habitat indicators is provided below.

- Spatial Boundary: Marine Fish and Fish Habitat LSA – although the physical effects to marine fish habitat will be limited to the Footprint, the productive capacity of surrounding habitats may be affected as a result of decreased productivity (*e.g.,* algal biomass) and decreased prey availability.
- Duration: short-term - the activities and works that have the potential to affect marine fish and fish habitat will occur during the construction of in-water and shore-based infrastructure, which is expected to take approximately 2 years.
- Frequency: isolated – the activities and works that have the potential to affect marine fish and fish habitat will be limited to the construction phase.
- Reversibility: medium-term to permanent – although the loss of marine fish habitat is considered to be permanent, productive capacity will be restored once biotic communities become fully established on the marine compensation habitat (expected to take 2 to 3 years) and the intertidal and subtidal rip rap habitat created as a result of infilling.
- Magnitude: low – with the implementation of a marine fish habitat compensation program and the other mitigation measures described in Section 7.6.9, there will be no net loss of the productive capacity of marine fish habitat.

- Probability: high – the proposed in-water construction activities at the Westridge Marine Terminal are likely to result in the loss of marine fish habitat, causing a temporary decrease in productive capacity, as well as the injury or mortality of a small number of fish and invertebrates.
- Confidence: high – based on a good understanding by the assessment team of the cause-effect relationships between construction of the Westridge Marine Terminal and effects on marine fish and fish habitat, and a good understanding of the effectiveness of the proposed mitigation measures including the marine fish habitat compensation program.

Summary

As identified in Table 7.11.1-11, there are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on marine fish and fish habitat of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the Project on marine fish and fish habitat indicators will be not significant.

2 Significant Residual Environmental Effect: A high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.12 Wildlife and Wildlife Habitat

The evaluation of the effects of the Project on wildlife and wildlife habitat considered the combined effects of applicable Project components on the 26 wildlife and wildlife habitat indicators.

The evaluation of the combined effects of the Project on each of the wildlife and wildlife habitat indicators noted in Table 7.11.1-12 (points 1[a]to 26[a]) reflect the construction and operations of the pipeline, temporary facilities, pump stations (including power lines), storage tanks and Westridge Marine Terminal. Tables 7.2.10-6, 7.2.10-9, 7.2.10-12 and 7.2.10-15 and accompanying discussion in Sections 7.2.10.9, 7.2.10.10, 7.2.10.11 and 7.2.10.12 provide an evaluation of significance of the combined effects on the wildlife indicators.

<u>Combined Effects of the Project on Wildlife and Wildlife Habitat</u>

Pipeline construction and operations activities have the potential to affect wildlife and wildlife habitat through changes in habitat, movement and mortality risk. Section 7.2.10 describes the anticipated effects on wildlife and wildlife habitats, which considers all the Project components in an integrated manner. The characterization of magnitude for each indicator incorporated quantitative metrics and accepted biological thresholds or standards, where available. The ecological context, including sensitivity of the indicator, was considered in the determination of magnitude. The magnitude evaluation also considered relevant land use and recovery planning objectives and strategies, and previous environmental assessments for projects of similar scope. These sources provide useful information on social values and risk tolerance, which are an essential component of significance determination. With application of the proposed mitigation, the overall predicted effects for the wildlife and wildlife habitat indicators are concluded to be of medium magnitude.

A summary of the rationale for all of the significance criteria of combined effects of the Project on the wildlife and wildlife habitat indicators is provided below, assuming the largest effect criteria rating predicted for the suite of indicators.

- Spatial Boundary: RSA – habitat changes and alteration of movement will be limited to the Wildlife LSA; however, changes in mortality risk for many indicators are assessed at the regional scale.
- Duration: short-term – the events causing effects are construction and operational activities (*e.g.,* monitoring, vegetation management and site-specific maintenance), the latter of which are limited to any one year during operations.
- Frequency: periodic – the events causing effects will occur during construction and intermittently during operations for monitoring, vegetation control and maintenance.
- Reversibility: long-term – effects are reversible in the long-term following decommissioning and abandonment, once native vegetation regenerates over the Project Footprint.
- Magnitude: medium – the construction and operations of the Project will cause a reduction in effective habitat for most wildlife indicators, change movement patterns (in some cases potentially creating barriers or filters to movement) and increase wildlife mortality risk. The Project is likely to affect a variety of wildlife species, including common, abundant and resilient species, as well as rare or uncommon and sensitive species. The proposed mitigation measures have been developed to align with regulatory guidelines and recommendations, as well as regional resource management objectives and strategies. Application of appropriate mitigation is expected to reduce the magnitude of Project effects on the wildlife and wildlife habitat indicators to low to medium magnitude.
- Probability: high – the Project will alter habitat, movement patterns and mortality risk to affect the wildlife indicators.
- Confidence: moderate – for most indicators, the assessment is based on a good understanding of cause-effect relationships and relevant data, with some limitations and uncertainty associated with available data specific to the Project area, resulting in a moderate confidence level. The assessment of some indicators has low confidence given the limitations of current scientific knowledge (*i.e.,* research and published literature relevant to effects pathways and response) and available data relevant to the Project area. Confidence in the conclusion for some wildlife and wildlife habitat indicators is expected to improve with completion of supplemental studies and analysis for the Project.

Summary

As identified in Table 7.11.1-12, there are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on a wildlife indicator of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the pipeline and facilities component of the Project on wildlife and wildlife habitat indicators will be not significant.

Notes: 1 LSA = Wildlife LSA; RSA = Wildlife RSA.

2 Significant Residual Environmental Effect: a high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.13 Marine Mammals

The evaluation of the effects of the Project on marine mammals considered the combined effects of applicable Project components (*i.e.,* construction and operations of the Westridge marine Terminal) on the marine mammal indicator: harbour seals.

Combined Effects of the Project on Marine Mammals

Since the harbour seal is the only indicator for marine mammals, combined effects of the Project on marine mammals are the same as combined effects of the Project on harbour seals. The significance evaluation for combined effects on marine mammals (*i.e.,* effects of Westridge Marine Terminal on the harbour seal indicator) is provided in Section 7.6.11.6 and summarized in Table 7.11.1-13, point 2(a).

There is no local or regional management plan with specific goals and objectives applicable to marine mammals to aid in the assessment of Project-related effects on the marine mammals indicator. The Port Metro Vancouver Consolidated Land Use Plan 2010 (PMV 2010) does, however, note the generally-applicable objectives of exercising responsible environmental stewardship of PMV water areas so that growth and development takes place in an environmentally sensitive and sustainable manner, and of exploring innovative environmental mitigation measures and strategies to minimize the environmental impacts of growth. Both of these objectives are encompassed within the assessment and proposed mitigation measures for marine mammals.

Summary

As identified in Table 7.11.1-13, there are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on marine mammals of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the pipeline and facilities component of the Project on the marine mammals indicator will be not significant.

2 Significant Residual Environmental Effect: A high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.14 Marine Birds

The evaluation of the effects of the Project on marine birds considered the combined effects of applicable Project components (*i.e.,* construction and operations of the Westridge marine Terminal) on the marine bird indicators: bald eagle; great blue heron; pelagic cormorant; Barrow's goldeneye; glaucous-winged gull; and spotted sandpiper.

The evaluation of the combined effects of the Project on each of the above marine bird indicators noted in Table 7.11.1-14 (points 1[g], 2[g], 3[g], 4[g], 5[g] and 6[g]) reflect the construction and operations of the Westridge Marine Terminal since this is the only Project component affected. Table 7.6.12-3 and the accompanying discussion in Section 7.6.12.6 provide an evaluation of significance of the combined effects on these indicators.

Combined Effects of the Project on Marine Birds

The combined effects of construction and operations of the Westridge Marine Terminal on marine birds includes potential habitat loss from clearing and construction at the shoreline and nearshore foraging areas of the Marine Birds LSA, and disturbance from noise, night-lighting and human activities associated with development and expansions of terminal facilities. The objectives of the Project are to avoid, or limit, any potential adverse effects from activities related to construction and operations through the use of acceptable and effective mitigation measures and environmental management procedures. Primary goals of the Project include supporting the objectives of local land management plans, parks and conservation areas within the Marine RSA, and environmental management of local ecological values, such as the Burrard Inlet Environmental Action Program. Working with and obtaining ecological knowledge from local groups, such as the Tsleil-Waututh Nation, Maplewood Flats Conservation Area and Pacific Wildlife Foundation, will facilitate these objectives.

Local management plans, such as the Burrard Inlet Environmental Action Program (2002) are focused on managing valued habitats in the Burrard Inlet, maintaining and enhancing the quality of existing ecosystems, and preservation of biodiversity, Other objectives include ensuring industry compliance with the BC *Wildlife Act*, *Migratory Birds Convention Act* (MBCA), and other provincial and federal legislative guideline that protect and preserve biodiversity values and species at risk. The Marine RSA is a component of the larger Burrard Inlet and English Bay Important Bird Area that recognizes the importance of these habitats to migrating and resident marine birds and seeks to protect their associated habitats. These objectives can be addressed during the construction and operations of the expansion of the Westridge Marine Terminal by the application of a comprehensive set of management plans that include mitigation measures to avoid adverse effects to marine birds and other wildlife. Environmental inspection prior to and during construction, and collaboration with local stakeholders, the directors of ecological conservation areas, parks and protected areas, and with local Aboriginal communities will ensure there is a forum for information gathering, to facilitate the continued management of wildlife habitat, marine birds, and the support of local community objectives.

Through a background of ecological knowledge of the surrounding local and regional marine areas, and the implementation of best management practices and mitigation measures, it is believed that the Project can meet the objectives for protection of marine bird species, species at risk, traditional use and regional biodiversity values, namely to minimize the potential for loss of habitat, and wildlife disturbance, injury or mortality. Primarily with consideration of the context of existing commercial and industrial development, shipping and other marine traffic and activities; and with the application of appropriate mitigation measures primarily associated with avoiding disturbance to marine birds that may be foraging or nesting within the Marine Birds LSA, the combined effects to marine birds from the expansion of the Westridge Marine Terminal are considered to be not significant (Table 7.11.1-14, point 7[a]).

- Spatial Boundary: Marine RSA – combined effects from construction and operations could potentially occur within all spatial scales of the assessment area.
- Duration: long-term – combined effects may occur during construction and throughout the operations phase for the life of the Project.
- Frequency: periodic – combined effects have the potential to occur on a regular basis and extend for the life of the Project.
- Reversibility: medium-term – potential combined effects of sensory disturbance and habitat alteration or loss are expected to recover in less than 10 years.
- Magnitude: low – combined effects will be detectable at the individual level but if mitigated may not be detectable at the population level with consideration for the context of abundant industry in the Marine RSA.
- Probability: high – the Project is likely to have combined effects.
- Confidence: high – based on a good understanding by the assessment team of cause-effect relationships between the Project activities and marine birds.

Summary

As identified in Table 7.11.1-14, there are no situations where there is a high probability of occurrence of a permanent or long-term environmental effect on a marine birds indicator of high magnitude that cannot be technically or economically mitigated. Consequently, it is concluded that the environmental effects of the Project on marine birds indicators will be not significant.

TABLE 7.11.1-14

SIGNIFICANCE EVALUATION OF THE PROJECT ON MARINE BIRDS

Potential Effect		Impact Balance	Spatial Boundary[1]	Temporal Context			Magnitude	Probability	Confidence	Significance[2]
				Duration	Frequency	Reversibility				
1.	Marine Bird Indicator – Bald Eagle									
1(a)	Combined effects from pipeline.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
1(b)	Combined effects from temporary facilities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
1(c)	Combined effects from pump station activities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
1(d)	Combined effects from tanks.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
1(e)	Combined effects from Westridge Marine Terminal.	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant
1(f)	Combined effects from pipeline reactivation.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
1(g)	Combined effects of the Project on the bald eagle indicator (1[e]).	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant
2.	Marine Bird Indicator – Great Blue Heron									
2(a)	Combined effects from pipeline.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
2(b)	Combined effects from temporary facilities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
2(c)	Combined effects from pump station activities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
2(d)	Combined effects from tanks.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
2(e)	Combined effects from Westridge Marine Terminal.	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant
2(f)	Combined effects from pipeline reactivation.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
2(g)	Combined effects of the Project on the great blue heron indicator (2[e]).	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant
3.	Marine Bird Indicator – Pelagic Cormorant									
3(a)	Combined effects from pipeline.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
3(b)	Combined effects from temporary facilities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
3(c)	Combined effects from pump station activities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
3(d)	Combined effects from tanks.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
3(e)	Combined effects from Westridge Marine Terminal.	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant
3(f)	Combined effects from pipeline reactivation.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
3(g)	Combined effects of the Project on the pelagic cormorant indicator (3[e]).	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant
4.	Marine Bird Indicator – Barrow's Goldeneye									
4(a)	Combined effects from pipeline.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
4(b)	Combined effects from temporary facilities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
4(c)	Combined effects from pump station activities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
4(d)	Combined effects from tanks.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
4(e)	Combined effects from Westridge Marine Terminal.	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant
4(f)	Combined effects from pipeline reactivation.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
4(g)	Combined effects of the Project on the Barrow's goldeneye indicator (4[e]).	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant
5.	Marine Bird Indicator – Glaucous-winged Gull									
5(a)	Combined effects from pipeline.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
5(b)	Combined effects from temporary facilities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
5(c)	Combined effects from pump station activities.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A

62(f)	Combined effects from pipeline reactivation.	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
6(g)	Combined effects of the Project on the spotted sandpiper indicator (6[e]).	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant
7.	Combined Effects of the Project on Marine Birds									
7(a)	Combined effects of the Project on the marine birds indicators (1[g], 2[g], 3[g], 4[g], 5[g] and 6[g]).	Negative	RSA	Long-term	Periodic	Medium-term	Low	High	High	Not significant

Notes: 1 RSA = Marine RSA.

2 Significant Residual Environmental Effect: A high probability of occurrence of a permanent or long-term residual effect of high magnitude that cannot be technically or economically mitigated.

7.11.1.15 Species at Risk

Refer to Section 7.11.1.7 Fish and Fish Habitat, Section 7.11.1.9 Vegetation, Section 7.11.1.11 Marine Fish and Fish Habitat, Section 7.11.1.12 Wildlife and Wildlife Habitat, Section 7.11.1.13 Marine Mammals and Section 7.11.1.14 Marine Birds.

7.11.2 Summary of the Changes to the Project Caused by the Environment

Environmental conditions such as flooding, geotechnical hazards, seismic hazards, wildfire and climate change were considered to have the potential to adversely affect the Project either during construction or operations or both. However, through the implementation of the mitigation measures provided in Table 7.10-2, the effects on the Project caused by the environment are reduced and considered to be not significant.

APPENDIX 7.1

SUMMARY OF LAND AND RESOURCE USE MANAGEMENT PLANS, MUNICIPAL DEVELOPMENT PLANS AND GOVERNMENT POLICIES CONSIDERED IN THE ENVIRONMENTAL EFFECTS ASSESSMENT

		Element[1,2,3]								
Name of Plan	Summary of Plan	Physical and Meteorological Environment	Soil and Soil Productivity	Water Quality and Quantity	Air Emissions/GHG Emissions	Acoustic Environment	Fish and Fish Habitat	Wetland Loss or Alteration	Vegetation	Marine Sediment and Water Quality, Marine Fish and Fish Habitat, Marine Mammals and Marine Birds
<u>Alberta</u>										
Water for Life – Alberta's Strategy for Sustainability (AENV 2003d) Water for Life – A Renewal (Alberta Environment 2008) Water For Life – Action Plan (Alberta Environment 2009)	• The goals of this strategy are to ensure: safe, secure drinking water supply; healthy aquatic ecosystems; and reliable, quality water supplies for a sustainable economy. To that end, Albertans will be assured their drinking water is safe, the province's aquatic ecosystems are maintained and protected, and water is managed effectively to support sustainable economic development.	• N/A	• N/A	• Safe, secure drinking water supply. • Healthy aquatic ecosystems. • Reliable, quality water supplies for a sustainable economy.	• N/A	• N/A	• Healthy aquatic ecosystems. • Protection of aquatic ecosystems in critical areas. • Establishment of priorities for sustaining aquatic ecosystems to be implemented through watershed plans. • Protect Alberta's critical aquatic ecosystems and develop a provincial action plan to improve the health of substantially impacted aquatic ecosystems.	• Heathy aquatic ecosystems.	• N/A	• N/A
Integrated Watershed Management Plan for the North Saskatchewan River in Alberta (North Saskatchewan Watershed Alliance 2012)	• The goals of this plan relate to water quality, instream flow needs, aquatic ecosystem health, quality and quantity of non-saline groundwater, and incorporating watershed management into land use planning in the North Saskatchewan River Watershed.	• N/A	• N/A	• Maintain or improve water quality in the North Saskatchewan River watershed. • Ensure that instream flow needs in the North Saskatchewan River watershed are met.	• N/A	• N/A	• Maintain and restore riparian areas and minimize or reduce the impacts of municipal and industrial development on aquatic ecosystem health.	• Healthy aquatice ecosystems. • Protect, maintain and restore wetlands.	• Maintain and rstore riparian areas.	• N/A
Strathcona County Municipal Development Plan Bylaw 1-2007 (Strathcona County 2007)	• The purpose of this plan is to aid in making decisions pertaining to growth and development in an orderly manner over the next 20 years and beyond, and presents the means by which the long-term goals of the county can be achieved. The approach to sustainability focuses on the social, economic and environmental elements of the community.	• N/A	• Protect, wherever possible, agricultural land which has a Canada Land Inventory soil class ranking of 1 or 2. • Protect areas prone to flooding, erosion, soil instability and other potential hazards. • Ensure no development is permitted adjacent to the North Saskatchewan River Valley, lakes or other watercourses which would lead to soil erosion or shoreline damage. • Discourage further clearing or development in areas where native vegetation is important for soil conservation, unless it is demonstrated to the County's satisfaction, that these resources will not be negatively affected.	• Improve surface and subsurface water quality. • Reduce the consumption of freshwater resources from lakes, rivers and aquifers. • Work with the appropriate jurisdictions to establish an ongoing groundwater monitoring and comprehensive water testing program to protect and maintain groundwater quality and quantity. • Protect lands where sensitive groundwater resources have been identified through environmental protection instruments and policies.	• Work with those agencies having jurisdiction, to assist in identifying existing and potential air quality concerns and to mitigate or eliminate these issues. • Aid in the reduction of GHG emissions. • Encourage industrial associations, the federal government and the provincial government to collaboratively expand and implement a regional airshed monitoring system.	• N/A	• Ensure no development is permitted along the North Saskatchewan River Valley, lakes or other watercourses that would negatively impact fish habitat. • Create development guidelines to protect land and riparian areas along watercourses and waterbodies.	• The plan discusses the development of a wetland policy to ensure wetlands and/or low areas are not filled in, drained or altered to accommodate development except where sanctioned by the approving authority.	• Discourage further clearing or development in areas where native vegetation is important for soil conservation, water resources protection or wildlife habitat. • Develop a County policy for the requirement of tree retention and tree planting programs.	• N/A

Name of Plan	Summary of Plan	Element[1,2,3]							
		Physical and Meteorological Environment	Soil and Soil Productivity	Water Quality and Quantity	Air Emissions/GHG Emissions	Acoustic Environment	Fish and Fish Habitat	Wetland Loss or Alteration	Vegetation	Marine Sediment and Water Quality, Marine Fish and Fish Habitat, Marine Mammals and Marine Birds
The Way We Grow: Municipal Development Plan, Bylaw 15100 (City of Edmonton 2010)	• The objectives of this plan are to: support sustainable urban form; integrate land use and transportation; design complete, healthy and livable communities; encourage urban design; support prosperity; protect, preserve and enhance the natural environment; support working within our region; manage land and resources; and maintain food and urban agriculture.	• N/A	• Recognize the value of agricultural characteristics, including micro climate, soil capabilities and moisture content, to contribute to sustainable food and agriculture systems for Edmonton.	• Protect, maintain and continually enhance the water quality of the North Saskatchewan Watershed. • Ensure water resources are conserved and used efficiently by the public, industry and the City of Edmonton.	• Monitor and improve air quality in Edmonton. • The plan describes general framework for policies and initiatives on emission reductions without laying out any specific targets, goals or objectives.	• N/A	• N/A	• To protect, maintain and incorporate natural wetlands into new and existing development.	• Protect, preserve and enhance a system of conserved natural areas. • Restore ecologically degraded and / or damaged ecological systems and linkages to protect, expand and enhance biodiversity.	• N/A
Growing Forward – the Capital Region Growth Plan (Capital Region Board 2009)	• The purpose of this plan is to: provide an integrate and strategic approach to planning for future growth in the Capital Region; identify the overall development patterns and key future infrastructure investments that would best complement existing infrastructure, services and land uses; and coordinate decisions in the Capital Region to sustain economic growth and ensure strong communities and a healthy environment.	• N/A	• N/A	• Minimize the impact of development on regional watersheds.	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A
Your Bright Future: Municipal Development Plan 2010-2020 (City of Spruce Grove 2010)	• The overarching objective of this plan is to provide a framework to direct growth and change in Spruce Grove to 2020 in a way that conforms to the City's interpretation of community sustainability. The concepts of balance and adaptability underlie this framework.	• N/A	• N/A	• Develop an integrated watershed management approach that will sustainably manage the impact of development on the watershed, conserve water use and improve water quality. • Prohibit the discharge of hazardous wastes or contaminants into surface water or groundwater. • Work with developers, landowners and AENV to protect surface water and groundwater flow which supports environmentally significant areas affected by development within the City of Spruce Grove boundaries.	• Pursue strategies to reduce corporate and community greenhouse gas emissions and improve air quality.	• N/A	• N/A	• To protect and maintain natural areas within the City of Spruce Grove. The city has identified environmentally significant areas within it's boundaries. An assessment of a proposed development is required for developments that may affect one of these environmentally significant areas.	• Preserving green space both within the city and surrounding areas. • To protect and maintain natural areas within the City of Spruce Grove. The city has identified environmentally significant areas within it's boundaries. An assessment of a proposed development is required for developments that may affect one of these environmentally significant areas. • Connect residents to nature and educate them on value of environmentally significant areas.	• N/A
City of Spruce Grove Environmental Sustainability Action Plan (City of Spruce Grove 2011)	• The objectives of this plan are to: protect and enhance natural areas, green space and biodiversity; live within the capacity of our natural resources of air, land, water and energy; and to lead by example through stewardship and a creative approach.	• N/A	• N/A	• Maintain quality of local watersheds. • Reduce water consumption.	• To reduce GHG emissions.	• N/A	• N/A	• N/A	• Protect sustainable natural areas. • Provide residents access to green space.	• N/A

Name of Plan	Summary of Plan	Element[1,2,3]								
		Physical and Meteorological Environment	Soil and Soil Productivity	Water Quality and Quantity	Air Emissions/GHG Emissions	Acoustic Environment	Fish and Fish Habitat	Wetland Loss or Alteration	Vegetation	Marine Sediment and Water Quality, Marine Fish and Fish Habitat, Marine Mammals and Marine Birds
Town of Stony Plain Municipal Development Plan 2005-2020 (Town of Stony Plain 2005)	• This plan provide directions to manage growth and development over the next 15 years to accommodate population growth. Some of the guiding principles of the plan are to: preserve and enhance the quality of life for residents of Stony Plan; pursue mutually beneficial regional partnerships and alliances; maintain a small town atmosphere; and promote environmental stewardship by protecting and preserving natural areas.	• N/A	• N/A	• Protect and integrate natural watercourses and natural areas in new development.	• Care must be taken in siting industrial uses which may pose a risk or have nuisance affects (*e.g.* smell, dust) on nearby residents. • Ensure that adequate separation distances and transition between industrial and non-industrial uses are maintained in siting potentially noxious industry that may create land use conflicts with regard to dust, smoke or odour.	• Care must be taken in siting industrial uses which may pose a risk or have nuisance affects (*e.g.* noise) on nearby residents. • Ensure that adequate separation distances and transition between industrial and non-industrial uses are maintained in siting potentially noxious industry that may create land use conflicts with regard to noise or vibration.	• N/A	• Maintain wetlands with a minimum 10 m setback starting at the 1:100 year highwater mark. However, this is geared more towards lot developments.	• Preserve and enhance the quality of life for residents by maintaining attractive parks and open spaces. • Promote environmental stewardship by protecting and preserving natural areas and encouraging environmentally sound practices.	• N/A
Village of Wabamun Municipal Development Plan (Village of Wabamun 2010)	• This plan seeks to harness the ideas and creativity of the Village of Wabamun's Council and residents, and articulate these ideas as goals and objectives for future development. The plan facilitates multi-faceted growth and development, encourages the maintenance of a physical separation between incompatible land uses, and encourages the preservation and maintenance of the quality of life, among other goals.	• Developments should be suited to existing topography and other natural features of the area to minimize cut-and-fill and grading throughout the site.	• No proposed development shall be approved by the Village where it is shown that the proposal shall cause or result in unnecessary financial burdens to the Village or future residents because of soil contamination. • Prior to considering the approval of any development permit, the Development Authority may require a soil analysis.	• N/A	• Normal use of industrial sites shall be such that it does not unduly interfere with the surrounding land uses by way of dust, harmful or objectionable odours or emissions.	• Normal use of industrial sites shall be such that it does not unduly interfere with the surrounding land uses by way of noise or vibration.	• N/A	• No applicable goals or objectives specific to wetlands. However, the plan includes development ideas for recreational use associated with the wetlands in the area.	• Use vegetation to reduce storm water run-off and reduce energy consumption through shading, wind protection, decreased irrigation and water consumption. • Enhance visual aesthetics by increasing vegetation cover.	• N/A
Entwistle Area Structure Plan Bylaw No. 23-2012 (Parkland County 2012)	• The purpose of this plan is to provide direction for balanced and sustainable development of the Hamlet of Entwistle and its surrounding. The plan will guide future development by supporting and directing growth that will be capable of meeting the residential, service, commercial and community needs of the area's residents.	• N/A	• To support a rural community that works towards protecting the natural systems that support life by minimizing soil pollution.	• To support a rural community that works towards protecting the natural systems that support life by minimizing water pollution. • To manage storm water in a manner that sustains the quality and quantity of water being released into the County's water features.	• Land uses that cause the creation of odor, dust, and smoke will be discouraged within a 200 m buffer area of residential land designations.	• Land uses that cause the creation of noise will be discouraged within a 200 m buffer area of residential land designations.	• N/A	• N/A	• N/A	• N/A

Name of Plan	Summary of Plan	Element[1,2,3]								
		Physical and Meteorological Environment	Soil and Soil Productivity	Water Quality and Quantity	Air Emissions/GHG Emissions	Acoustic Environment	Fish and Fish Habitat	Wetland Loss or Alteration	Vegetation	Marine Sediment and Water Quality, Marine Fish and Fish Habitat, Marine Mammals and Marine Birds
Parkland County Municipal Development Plan, Bylaw No. 37-2007 (Parkland County 2007)	• The guiding principles of the plan are to achieve sustainability while still protecting existing lifestyles and established land use patterns by: supporting environmental sustainability; supporting fiscal sustainability; supporting social sustainability; emphasizing economic development; respecting community character; and maintaining a reasonable degree of land use certainty.	• N/A	• The County supports communities that are designed to minimize soil pollution. • Protect and enhance the County's valuable agricultural land resource, while still accommodating appropriate non-agricultural land uses. • Promote agricultural practices that are sustainable and environmentally responsible. • Conserve agricultural lands for agricultural and related uses.	• Maintain the environmental integrity of the County's rivers, streams and lakes. • To protect the quality and quantity of surface and groundwater,	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A
Parkland County Integrated Community Sustainability Plan (Parkland County 2011)	• The purpose of this plan is to provide direction for the communities within Parkland County to realize sustainability objectives it has for the environmental, social/cultural, governance and economic dimensions of its identity.	• N/A	• N/A	• Minimize water use, waste water volume and water contamination. • Minimize the destruction of waterways, wetlands and riparian areas.	• The plan mentions efforts and plans for energy conservation and GHG emissions reduction options within the scope of community operations.	• N/A	• Minimize the destruction of waterways and riparian areas.	• Protect water resources by minimizing the destruction of wetlands.	• Minimize the destruction to riparian areas. • Showcase the benefits of sustainable gardening and sustainable farming to residents of Parkland County.	• N/A
Hamlet of Evansburg Area Structure Plan Bylaw No. 12.03 (Yellowhead County 2003)	• The objectives of this plan are to: identify and encourage new residential and non-residential development in Evansburg and its periphery; identify opportunities to enhance existing commercial and public spaces; and improve the quality of life for community landowners, residents and visitors.	• A geotechnical engineer with coal mine engineering experience should review the potential undermining hazards on lands which may have been subject to past mining operations.	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A
Hamlet of Wildwood Area Structure Plan (Yellowhead County 2005)	• The objectives of this plan are to: provide lifestyle options and development opportunities for Wildwood and area residents; protect the integrity of existing developments by building upon what exists; create a Hamlet General District that allows for a mix of potentially compatible uses; and to optimize the use of existing infrastructure and facilities.	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A	• Maintain natural vegetation and add strategically located trees to provide color and shade for sitting spaces.	• N/A
Town of Edson Municipal Development Plan (Town of Edson 2006)	• This plan is a statement of how the Council and residents of the Town of Edson wish to see the community evolve over the next fifteen to twenty years. Some of the objectives of the plan are to maximize the quality of life of town residents, provide for growth to occur in an orderly and efficient manner, and to preserve and enhance important local heritage features.	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A	• Protect and consider environmental features such as existing vegetation.	• N/A

Name of Plan	Summary of Plan	Element[1,2,3]								
		Physical and Meteorological Environment	Soil and Soil Productivity	Water Quality and Quantity	Air Emissions/GHG Emissions	Acoustic Environment	Fish and Fish Habitat	Wetland Loss or Alteration	Vegetation	Marine Sediment and Water Quality, Marine Fish and Fish Habitat, Marine Mammals and Marine Birds
Edson Urban Fringe Intermunicipal Development Plan (Yellowhead County 2007)	• This plan provides a framework for the long-term growth and development of the lands located within the Edson Fringe Plan Area that includes lands in Yellowhead County and the Town of Edson. The objectives of the plan include joint municipal plan objectives, objectives for lands within the town of Edson, and objectives for lands within Yellowhead County.	• Any applicant for an industrial subdivision or development application may be required to complete an Area Structure Plan that will consider those items listed in section 118(8) of the RI District that include: the environmental suitability of the site with particular consideration to slopes and drainage.	• Any applicant for an industrial subdivision or development application may be required to complete an Area Structure Plan that will consider those items listed in section 118(8) of the RI District that include: the environmental suitability of the site with particular consideration to soils. • The purpose of Rural District areas is to provide for uses which are appropriate in a rural environment and support or can co-exist in areas of agricultural use.	• Cooperate in the protection of the McLeod River and Bench Creek aquifer recharge areas and drainage channels that are important to the integrity of the local water supply and environment.	• N/A	• N/A	• Cooperate in the protection of the McLeod River and Bench Creek drainage channels that are important to the integrity of the environment.	• N/A	• Preserve natural landforms and vegetation through the development process as a means to protect the natural visual quality in Yellowhead County and to provide screening for new development. • Limit clear cutting – pipeline rights-of-way to be better maintained and cleared of weeds.	• N/A
Town of Hinton Municipal Development Plan (Town of Hinton 1998)	• This plan provides guidance for public and private development decisions within the Town. It provides a means of coordinating the thinking and actions of the Town and directing it towards achieving immediate and long term land use goals and aspirations. The Plan is a guide for future development – a framework for decision making.	• Given the Town of Hinton's dramatic topography, every opportunity should be made for protecting land in areas of steep slopes. • Development should be designed to provide a functional relationship to the site's topography.	• N/A	• N/A	• Industrial developments need to be developed in such a manner that minimizes negative impacts (*e.g.*, odour and dust).	• Industrial developments need to be developed in such a manner that minimizes negative impacts (*e.g.*, noise).	• N/A	• N/A	• Provide a focal improvement in park and trail spaces that access the Athabasca River waterfront. Working in partnership with others; design and build a waterfront park and related trail infrastructure.	• N/A
Town of Hinton Community Development and Enhancement Plan (Town of Hinton 2003)	• This plan integrates the Town of Hinton Parks Master Plan, Visitor Attractions Plan and Urban form Plan. The underlying objective of this three-part plan is to provide a practical and effective framework for community development and enhancement within the Town of Hinton.	• Hinton values the natural surrounding environment and is committed to development which is in harmony with the natural features of the area.	• N/A	• N/A	• N/A	• N/A	• N/A	• Hinton values the natural surrounding environment and is committed to development which is in harmony with the natural features of the area.	• Hinton values the natural surrounding environment and is committed to development which is in harmony with the natural features of the area.	• N/A

Yellowhead County Municipal Development Plan Bylaw No. 1.06 (Yellowhead County 2006)	• The purpose of this plan is to provide residents and Council with a framework to guide decision-making that is necessary to achieve the county's 20 year vision for the future. The plan has been developed to guide future policy, land use and infrastructure investment decisions, and strike a balance between economic, social, physical development and environmental considerations, among other goals.	• Prevent development in areas subject to known hazardous conditions, unless the hazard to development has been adequately addressed. • Prohibit development in areas that are prone to flooding, erosion, landslides, or any other natural or human-induced hazards. Development on escarpments, steep or unstable slopes (*e.g.*, slopes greater than 20%) may be considered only if recommended in a geotechnical study prepared by an accredited professional. • Where feasible, natural landforms will be preserved through the development process as a means to protect the natural visual quality in Yellowhead County.	• Consider requiring all structural developments to identify soil type during preliminary planning. All developments proposed on soils with evidence of peat, muskeg, sand dunes or soft lacustrine soils, must have a geotechnical assessment prepared which identifies measures to mitigate the substandard soils to ensure a safe building site. • Direct, where possible, non-agricultural development to areas where such development will not constrain agricultural activities. • Maintain and support agriculture as an important industry and way of life in Yellowhead County. • Ensure that agricultural uses are the primary use in this policy area. • Encourage the viability of agriculture through the conservation of agricultural land.	• Maintain and enhance surface and groundwater quality in water systems with a focus on the "Water for Life" strategy as developed by the Province of Alberta. • Continue to support the protection of aquifers in the region. • Work with the Province of Alberta to support a safe, secure drinking water supply for residents through ongoing record-keeping of water suppy and quality from surface and groundwater sources throughout Yellowhead County.	• N/A	• N/A	• N/A	• Although wetlands are considered to be environmentally sensitive lands and would generally require a 20 m buffer, consultation with the County has revealed that disturbances to wetlands from pipeline construction will be deferred to the province.	• Preserve vegetation through the development process as a means to protect the natural visual quality in Yellowhead County.	• N/A
Coal Branch Sub-Regional Integrated Resource Plan (Government of Alberta 1990)	• The purpose of this plan is to effectively mitigate conflicts between resource use objectives by determining resource priorities and allocating land uses for specific portions of the Coal Branch planning area on public lands.	• Protect representative and unique examples of the natural features, landscapes and ecosystems of the Foothills and Rocky Mountain Natural Regions of Alberta.	• Minimize erosion and soil losses resulting from land use activity. • Ensure that reclamation guidelines and standards minimize soil erosion and protect inherent soil productivity. • Where compatible with other resource uses, to maintain and expand the permanent agricultural land base. • Protect eolian soils east of Brule Lake from wind and water erosion by minimizing impacts on the area's sensitive eolian deposits. • Protect shallow soil resources from damage by land use activities.	• Ensure that land use activities are managed to provide optimal water yield in terms of quality, quantity and timing. • Maintain the long-term integrity of natural watercourses and ensure protection of the watersheds.	• N/A	• N/A	• Protect and enhance fish and fish habitat. • Maintain and/or increase habitat and populations of specific species including bull trout, Arctic grayling, rainbow trout, mountain whitefish, brook trout and walleye.	• N/A	• Preserve and maintain sites with sensitive vegetation.	• N/A

The Northern East Slopes Sustainable Resource and Environmental Management Strategy (Government of Alberta 2003)	• This plan guides the Northern East Slopes of Alberta region toward sustainable development while balancing economic, environmental and community values. Addressing current and emerging issues, the strategy provides clear, long-term direction for managing resources and activities on Crown lands while considering cumulative effects.	• Protect unique landscape elements.	• Ensure that regional soil quality receives a high priority in land-use planning and environmental impact assessment. • Ensure that best practices for the protection of soil are uniformly applied by all industries in the region. • Conserve soil resources to sustain primary productivity and minimize degradation and contamination. • Maintain soil fertility and minimize negative impacts of land use on the regional soil base. • Identify and apply best management practices for soil fertility, contamination and remediation. • Design an appropriate soil-monitoring program that addresses regional soil management issues. • Ensure that industrial, agricultural and recreational activities do not reduce soil fertility, with particular emphasis on sensitive areas and highly productive soils.	• Maintain the quality and quantity of the region's water resources to ensure the protection of the aquatic environment. • Manage water resources using an integrated watershed approach, recognizing the linkages between water quality/quantity and activities and disturbances. • Ensure that regional surface and groundwater quality meets or exceeds existing standards. • Ensure use of regional surface and groundwater resources remains at sustainable levels and that water supply and quality is adequate for downstream use.	• Maintain good air quality levels within the region. • Identify areas that require expanded monitoring efforts in order to provide a comprehensive picture of regional air quality.	• N/A	• N/A	• Protect and enhance wetland ecosystems. • Retain permanent and ephemeral wetlands.	• Maintain species richness and diversity on the landscape. • Protect rare vegetation (species designated as Endangered or Threatened under the Alberta *Wildlife Act*. • Minimize the introduction and spread of exotic vegetation species in the Green Area of Alberta. • Maintain a diversity of ecosystem types and local elements within the natural range of variability. • Maintain landscape connectivity and representative landscape patterns of vegetation. • Manage landscapes and vegetation in the region based on a broad –scale "coarser-filer" approach that considers natural disturbance regimes to achieve primary biodiversity objectives. • Establish objectives for salvage logging and for residual structure within the harvest areas, recognizing both the importance of wood fiber recovery and the importance of naturally disturbed habitat and residual vegetation for biodiversity.	• N/A

Jasper National Park of Canada Management Plan (Parks Canada 2010)	• The key strategies of this plan include: welcoming visitors to mountains of opportunity; bringing the mountains to people where they live; celebrating history, culture and the world heritage site; ensuring healthy ecosystems; fostering open management and innovation; strengthening Aboriginal relationships; and managing growth and development.	• There are no potential Project effects associated with physical environment indicators anticipated to result from pipeline reactivation activities in Jasper National Park, therefore goals and objectives of this plan related to the physical environment were not considered.	• N/A	• Maintain aquatic ecosystems within their range of natural variability for factors such as water quality, water levels and flow regimes. • Ensure that instream flow needs for aquatic and riparian areas take precedence over withdrawals or diversions of surface and ground water.	• N/A	• N/A	• Maintain aquatic ecosystems within their range of natural variability for factors such as native species. • Restore aquatic connectivity in locations where it has been disrupted by transportation or impoundment and where it will benefit aquatic communities. • Maintain/restore viable populations of native fish and other aquatic species, especially provincially or federally listed species and create a plan to manage non-native species. • Ensure that instream flow needs take precedence over withdrawals for aquatic and riparian area. • Work with the Province of Alberta to maintain or restore native populations of Athabasca rainbow trout and bull trout. • Develop/refine goals and markers to assess aquatic ecosystem health and understanding community function.	• Wetlands are not expected to be disturbed along the reactivated pipeline segments in Jasper National Park, therefore goals and objectives of this plan related to wetlands were not considered.	• Maintain or restore ecological integrity (use fire to maintain healthy vegetation, control of invasive plants).	• N/A
<u>BC</u>										
Mount Robson Park Management Plan (BC MOE 2011b)	• This management plan defines the role of Mount Robson Provincial Park in the BC protected areas system and establishes objectives and strategies to guide management and development.	• There are no potential Project effects associated with physical environment indicators anticipated to result from pipeline reactivation activities in Mount Robson Provincial Park, therefore goals and objectives of this plan related to the physical environment were not considered.	• N/A	• Protect and maintain water quality and quantity resources within the provincial park.	• N/A	• N/A	• Maintain and enhance fish populations.	• Wetlands are not expected to be disturbed along the reactivated pipeline segments in Mount Robson Provincial Park, therefore goals and objectives of this plan related to wetlands were not considered.	• The ecosystem management plan outlines objectives and actions for each zone pertaining items such as tbiodiversity conservation and forest health. • Maintain the long-term natural diversity of native plant species. • Ensure that any management actions employed are preceded by an assessment of plant species at risk present.	• N/A

Village of Valemount Official Community Plan (Village of Valemount 2006)	• This plan provides a framework for future growth through statements of objectives and policies as well as providing a degree of certainty about the future form and character of the municipality. It provides Village Council and the public with the basis to evaluate development proposals and to ensure that these proposals are consistent with the vision of the plan. In essence, the Plan is the village's central land use management policy document.	• It is the policy of Council to prevent development on the steep slopes (25% or greater) and areas where rock fall, land slip or erosion hazards are known or suspected. Council will, however, consider permitting development on steep slopes or areas subject to rock fall, land slips or erosion hazards if the developer provides a report from an engineer experienced in geotechnical engineering setting out how the area can be developed safely.	• It is the policy of Council to prevent development in areas where soil subsidence or erosion hazards are known or suspected. Council will, however, consider permitting development on areas subject to soil subsidence or erosion hazards if the developer provides a report from an engineer experienced in geotechnical engineering setting out how the area can be developed safely.	• Maintain the integrity of the Swift Creek Watershed so that the supply of drinking water is not adversely affected.	• N/A	• N/A	• N/A	• Protection of the Robert Starret Marsh south of the Village of Valemount.	• Use of vegetation as visual barriers to separate Central Business District and residential areas.	• N/A
Blue River Official Community Plan (TNRD 2011a)	• The purpose of this plan is to provide direction for future development and land uses within the identified Plan Boundary, which surrounds the community of Blue River. The plan contains objectives, policies and future land use designations adopted by the Board of Directors of the TNRD.	• New industrial development will be designed in such a manner as to maximize efficient use of the land and to fit into the natural form and character of the site.	• Support the preservation of agricultural lands and local food production.	• Ensure the protection of creeks, rivers, lakes, riparian areas and groundwater supplies within the plan area.	• To reduce GHG emissions.	• N/A	• Avoiding development near fish habitat whenever possible and, if development is necessary, follow federal and provincial regulations. • Ensure the protection of creeks, rivers, lakes and riparian areas within the plan area.	• N/A	• Encourage tree planting where appropriate and the retention of existing healthy trees and natural vegetation during new development.	• N/A
Robson Valley Land and Resource Management Plan-Summary (BC ILMB 1999)	• This plan provides broad direction for the sustainable use of Crown land and resources in the Robson Valley area. The plan balances economic, ecological, spiritual, recreational and cultural interests. It will help to provide greater land use certainty, preserve natural areas for future generations, maintain resource-sector jobs for local workers and increase opportunities for tourism and recreation.	• Identify high terrain hazard areas and manage development in these areas to minimize erosion and slope failures. • Exploration, mine development and other land uses that affect visual quality will utilize existing topography and ground conditions to reduce impact on visual values.	• To protect soil and soil fertility by minimizing activities that cause soil erosion and degradation. • Support the purpose and intent of the Agricultural Land Reserve (ALR). • Minimize conflict with other land use activities which may negatively impact the productivity and sustainability of agricultural uses of Crown resources.	• Protect or enhance surface water quality. • Protect or restore water quantity and natural hydrologic regime of each watershed.	• To reduce and work to eliminate pollution of air. • Minimize the use of slash burning to protect air quality.	• N/A	• To maintain or enhance species genetic diversity, abundance and compositions, and protect unique and rare species. • Conserve, restore or enhance the abundance and genetic diversity of naturally occurring fish stocks. • Protect or restore the structural, functional and biological diversity of stream and riparian habitat. • Maintain or enhance the benefits of Aboriginal, sport and commercial fisheries. • Ensure adequate instream flows and high water quality standards for sustainable fish populations. •	• Protect waterfowl habitat. • Locate roads away from wetlands. • Protect wetlands.	• Promote vegetation management strategies that maintain the quality and quantity of browse species (*e.g.,* willow and red osier dogwood, Saskatoon berries, hazel nuts) during stand management activities. • Maintain or enhance opportunities for use of Crown land, vegetation, and resources for agriculture, fisheries and food production. • Allow the control for competing brush to optimize growth, through effective vegetation management techniques. •	• N/A

		Physical and Meteorological Environment	Soil and Soil Productivity	Water Quality and Quantity	Air Emissions/GHG Emissions	Acoustic Environment	Fish and Fish Habitat	Wetland Loss or Alteration	Vegetation	Marine Sediment and Water Quality, Marine Fish and Fish Habitat, Marine Mammals and Marine Birds
Robson Valley Land and Resource Management Plan-Summary (BC ILMB 1999) (cont'd)	See above	See above	See above	See above	See above	• N/A	• Manage riparian areas adjacent to the McLennan River to ensure fish habitat and recreation values are maintained.	See above	• Control noxious weeds where necessary by implementing Noxious Weed Control plans and enforcing proper vegetation. • Manage riparian areas adjacent to the McLennan River. • Establish a 60 m riparian reserve and a 20 m riparian management zone above the high water mark. • Reduce the use of herbicides.	• N/A
Robson Valley-Canoe Upstream Official Community Plan (RDFFG 2006)	• The purpose of this plan is to state the broad land use objectives and policies of the Regional Board to guide decisions on planning and land use management for the Robson Valley-Canoe Upstream area within the RDFFG, as set out in the Local Government Act.	• To protect areas which may be subject to natural hazards including avalanche, rockfall, debris flows and torrents, flooding, unstable slopes, and high rates of erosion.	• To protect for agriculture those areas that have easy access to water for irrigation. • To encourage the establishment and maintenance of farms and the use of land within the Agricultural Land Reserve compatible with agricultural purposes and to guide other forms of development so as to minimize negative impacts on agricultural uses. • Not promote development of agricultural land for non-agricultural uses unless it is shown that there is no practical alternative location and that it will not be detrimental to the long term agricultural potential of the land.	• Protection of watercourses and adjacent habitat through the retention of natural vegetation in riparian areas next to streams and water bodies. • Ensure the protection of the water quality of watercourses.	• To reduce GHG emissions and air pollution.	• N/A	• Recognizes the importance of the Fraser River and tributaries to salmon populations, and take into account the effects on fish stocks during riparian development planning. • Development Permit requirements on riparian areas in certain watercourses in the Plan area.	• N/A	• Protection of watercourses and adjacent habitat through the retention of natural vegetation in riparian areas next to streams and water bodies. • Protect riparian flora and fauna and their associated habitats from potential impacts of a development through the retention of vegetation along the watercourses. • Screen commercial development from Highway 16 by retention of natural vegetation, or replanting of vegetation, where possible.	• N/A
Eight Peaks Sustainable Resource Management Plan (BC Ministry of Sustainable Resource Management 2003)	• The goal of this plan is to establish resource management objectives that create conditions that support forestry, heli-skiing and other winter recreation activities while incorporating the principles of sustainability and stewardship.	• N/A	• The biological richness and services of terrestrial processes (*e.g.*, soil productivity) should be maintained at all scales through time.	• N/A	• N/A	• N/A	• N/A	• N/A	• Integrate winter recreation activities with forest management to optimize economic and social benefits derived from both.	• N/A
District of Clearwater Official Community Plan (District of Clearwater 2012)	• This plan takes into account environmental sustainability, social sustainability, cultural sustainability and economic sustainability. The objectives related to environmental sustainability include: ensuring residents have a safe and sufficient supply of drinking water; sustainable growth; decreasing energy demands and GHG emissions; ensuring a safe and clean airshed; and ensuring the negative impacts of land use and development are minimized.	• To recognize and respect the development constraints imposed by environmental factors and to avoid development in hazardous areas or require adequate precautions, if development is unavoidable, to reduce the risk to citizens and property.	• To preserve agricultural land to ensure present and future food production. • Protect all ALR land for either soil based agriculture or for non soil bound agriculture.	• To protect and enhance the quality of Clearwater area lakes, rivers, streams and groundwater sources thereby supporting the Clearwater River and North Thompson River watershed ecosystem and the Russell, Hascheak, and McDougall Creek watersheds.	• To reduce GHG emissions. • Ensure the continuation of a fresh, clean and safe airshed.	• N/A	• N/A	• Preserve and enhance sensitive ecosystems including wetlands.	• Encourage vegetation growth (including invasive species) for ditch maintenance. • Encourage planting of vegetation that will transpire and filter groundwater. • Protection of riparian areas	• N/A

Nicola Valley Official Community Plan (TNRD 2011e)	• This plan includes objectives related to existing and future land use; residential, rural, commercial and industrial development; preserving agricultural land; use and development of transportation and public facilities; recreation opportunities; heritage conservation; protecting water resources and wildlife habitat; and reducing GHG emissions.	• To recognize and respect the development constraints imposed by environmental factors and to ensure that developments in hazardous areas are avoided or that adequate precautions are taken if development is unavoidable.	• All development shall incorporate soil conservation practices recognizing slope, soil type and precipitation, in order to prevent any increase in the sediment loading of streams and rivers in the Plan Area. • To preserve agricultural land to ensure present and future food production.	• All development shall incorporate soil conservation practices recognizing slope, soil type and precipitation, in order to prevent any increase in the sediment loading of streams and rivers in the Plan Area. • Particular attention to protection of stream banks and prevention of erosion material or deleterious substances entering the watercourse during development. • Activities involving landfill, diking, channelization or any change to the natural system of watercourses shall be discouraged except where such activities either: form part of a riverbank stabilization project designed to prevent erosion of agricultural land; or have been approved by the appropriate federal and provincial agencies having authority. • Recognize all Improvement District groundwater wells and surface water intake locations and provide necessary protection of these public utilities/facilities from development and potential sources of contamination.	• To be carbon neutral and reduce GHG emissions. • New industrial development should not emit substances which would have a detrimental effect on air quality.	• N/A	• Preservation of fisheries through the controlled disposition of Crown land and development of private land. • Particular attention to protection of stream banks and prevention of erosion material or deleterious substances entering the watercourse during development. • Appropriate federal or provincial approval for development around fish habitat and watercourses. • Encourage continuation of fish stocking, particularly in Guichon Creek.	• N/A	• Protection of riparian shoreline and streambank vegetation. • Preservation of natural vegetation including trees in all undeveloped and riparian areas.	• N/A
Avola Official Community Plan (TNRD 2011d)	• This plan includes objectives related to existing and future land use; residential, rural, commercial and industrial development; preserving agricultural land; use and development of transportation and public facilities; recreation opportunities; heritage conservation; protecting water resources and wildlife habitat; and reducing GHG emissions.	• New industrial development will be designed in such a manner as to maximize efficient use of the land and to fit into the natural form and character of the site.	• To preserve agricultural land to ensure present and future food production.	• Recognize and provide special protection for creeks, rivers and habitat areas within the Plan area.	• To be carbon neutral and reduce GHG emissions.	• N/A	• Recognize and provide protection for creeks and rivers within the Plan area. • Refer development proposals which may impact fisheries to appropriate government agencies.	• N/A	• Encourage tree planting where appropriate and the retention of existing healthy trees and natural vegetation during new development.	• N/A

Name of Plan	Summary of Plan	Element[1,2,3]								
		Physical and Meteorological Environment	Soil and Soil Productivity	Water Quality and Quantity	Air Emissions/GHG Emissions	Acoustic Environment	Fish and Fish Habitat	Wetland Loss or Alteration	Vegetation	Marine Sediment and Water Quality, Marine Fish and Fish Habitat, Marine Mammals and Marine Birds
Kamloops Land and Resource Management Plan (BC ILMB 1995)	• The goals of this plan are: balanced use of the land and resources; protection and security of the land and resources for future generations; sustainable resource management practices; compatibility with natural watershed processes and respect for the intrinsic value of nature; social and economic stability and vitality of local communities; and communication, education, and awareness of all values, including those of Aboriginal peoples.	• N/A	• Minimize soil productivity losses. • Provide opportunities for growth and expansion of the agriculture industry.	• Primary objectives for Special Resource Management - Community Watershed Zones are to: - maintain the quality and quantity of community water supply; - minimize risk to lives and property from flooding and erosion; and - maintain natural stream flow regimes within acceptable limits. • Recognize interaction of groundwater and surface water sources.	• N/A	• N/A	• Maintain a mosaic of angling opportunities within the recreational spectrum (*i.e.*, walk-in lakes, drive-to lakes, trophy lakes). • Maintain or increase the natural production of spawning streams through habitat protection measures (*i.e.*, streamside management) and enhancement activities. • Protect and maintain the genetic diversity of wild fish stocks. • Maintain, rebuild or enhance salmon stocks to historic levels. • Achieve a net gain in productive capacity by habitat management. • Avoid irreversible human-made changes to fish-producing habitats. • Maintain the physical and biological diversity of fish habitats. • Optimize the value of commercial, sport, and Aboriginal fisheries.	• Maintain the integrity of wetlands.	• Maintain and/or restore the integrity and function of streamside riparian vegetation to provide for bank and channel stability, long-term supply of large organic debris, suitable stream temperatures and input of nutrients.	• N/A
KAMPLAN-Official Community Plan (City of Kamloops 2004)	• The goal of this plan is to provide the best quality of life for all residents by: building strong and diverse neighborhoods; providing a variety of housing types; encouraging healthy and active lifestyles; supporting cultural and athletic pursuits; diversifying economic and educational opportunities; and maintaining sustainable environmental stewardship.	• Preserve and creatively integrate existing trees and topographical features into the development where feasible. • Slopes steeper than 25% shall be considered unsuitable for development and shall be designated open space unless it can be shown by geotechnical or engineering studies that the steep slopes can accommodate the proposed development and that there will be no detrimental impact on adjacent lands or the proposed development.	• To ensure that agricultural lands are preserved for agricultural purposes and to enhance the viability of agricultural operations within the City of Kamloops.	• General goal to protect and enhance the quality of the natural environment.	• To reduce GHG emissions.	• N/A	• To protect and enhance fish habitats in balance with flood protection and recreational access to riverbank and open space areas. • To protect and enhance fish and wildlife habitats in balance with urban development and human use and enjoyment of open space.	• General goal to protect and enhance the quality of the natural environment.	• Maintain natural vegetation • Protect grasslands.	• N/A
Kamloops North Official Community Plan (TNRD 2011b)	• The purpose of this plan is to provide direction for future development and land uses within the area north of the City of Kamloops including: Mclure, Vinsulla, Black Pines, Heffley Lake, and Sullivan (Knouff) Lake. The plan contains objectives, policies, and future land use designations adopted by the board of directors of the TNRD.	• N/A	• To maintain and improve the viability of agricultural operations within the plan area, preserve land with agricultural capability and to support the ALR.	• To ensure the protection for creeks, rivers and lakes within the Plan area.	• To reduce GHG emissions.	• N/A	• Direct development away from spawning habitats within the Plan area. • Encourage the continuation of fish stocking programs by the Province of BC. • Encourage developers to refer potentially harmful proposals to the appropriate government agencies. • To ensure the protection for creeks, rivers and lakes within the Plan area.	• N/A	• Encourage tree planting where appropriate and the retention of existing healthy trees and natural vegetation during new development.	• N/A

Name of Plan	Summary of Plan	Element[1,2,3]								
		Physical and Meteorological Environment	Soil and Soil Productivity	Water Quality and Quantity	Air Emissions/GHG Emissions	Acoustic Environment	Fish and Fish Habitat	Wetland Loss or Alteration	Vegetation	Marine Sediment and Water Quality, Marine Fish and Fish Habitat, Marine Mammals and Marine Birds
Thompson-Nicola Regional District Regional Growth Strategy (TNRD 2000)	• This plan provides a framework for: taking action on development and settlement issues by the Regional District, its municipalities, and government agencies; coordinating efficient use of land, public facilities, services, finances, and other resources over the next 25 years; encouraging a variety of economic opportunities, land use choices, and quality of life attributes in an affordable and efficient manner; and ensuring the environment and natural amenities are protected and conserved as the region continues to develop.	• N/A	• N/A	• Protect and enhance the quality and quantity of the water of the region's lakes, rivers, streams and groundwater sources.	• Encourage the development and adoption of policies that contribute to the reduction or prevention of air pollution.	• N/A	• Promote conservation and sustainability of watershed ecosystems and riparian areas.	• Promote conservation and sustainability of wetland areas.	• Encourage tree planting where appropriate and the retention of existing healthy trees and natural vegetation during new development. • Promote conservation and sustainability of riparian areas. • Collaborate in the implementation of invasive terrestrial and aquatic plant management plans and integrated pest management plans to maintain natural biodiversity in the region.	• N/A
City of Merritt Official Community Plan (City of Merritt 2011)	• This plan provides Council and the public with direction for development and the basis to evaluate proposals to ensure these proposals are consistent with the vision. The intent of this plan is to provide an appropriate amount of planning direction while also providing flexibility to customize development to suit specific and unique circumstances within the city as well as facilitating creative and unusual development proposals.	• Natural features such as important trees, rock outcroppings and changes in topography should be maintained. • Ensure lands located on steep slopes, in ravines, directly adjacent to creeks and rivers in areas considered undevelopable remain in their natural condition. • Address site grading and drainage control measures in areas where steep slopes and unstable soils exist. • Prevent development within areas designated as hazardous slopes or unstable soils where hazards cannot be mitigated.	• Address site grading and drainage control measures in areas where steep slopes and unstable soils exist. • Prevent development within areas designated as unstable soils where hazards cannot be mitigated. • Support the preservation of agricultural lands and local food production within the municipal boundaries and beyond. • Minimize conflicts between agricultural operations and non-agricultural uses by encouraging buffering and setback provisions as suggested by the Ministry responsible for agricultural land.	• Encourage water conservation that restricts and reduces water usage and consumption. • Ensure future development and improvements respect the ecology of the Coldwater River and other streams in this sector including erosion prone riverbanks, fisheries values and the area identified as an environmental buffer along the southern shore. • Pursue water conservation measures and efforts aimed at managing demand for water.	• To reduce GHG emissions.	• N/A	• Support preservation of sensitive habitat adjacent to the Nicola River, the Coldwater River and other streams that is consistent with the appropriate best management practices for land development in providing protection for streams. • Promote the conservation of fish habitat along streams within the municipal boundary as defined under the *Riparian Areas Regulations* as part of the *Fish Protection Act*. • Ensure future development and improvements respect the ecology of the Coldwater River and other streams in this sector including erosion prone riverbanks, fisheries values and the area identified as an environmental buffer along the southern shore.	• N/A	• Ensure future development and improvements respect the ecology of the Coldwater River and other streams in this sector including erosion prone riverbanks and the area identified as an environmental buffer along the southern shore.	• N/A
District of Hope Official Community Plan (District of Hope 2004)	• This OCP is a municipal bylaw that sets the broad framework for managing development in the District of Hope by providing objectives for different land uses anticipated to meet future needs for a 5 to 10 year period. Additionally, the plan sets objectives for community services and facilities.	• Regulate development in areas with natural hazards in order to mitigate risk in such areas.	• Support the preservation and use of lands within the ALR for agricultural purposes.	• Protect riparian areas from the impact of the residential, commercial and industrial development, through ensuring that all development initiatives within 30 m of a watercourse are properly assessed as required under the *Fisheries Act* and its regulations.	• To reduce GHG emissions.	• N/A	• Protect riparian areas from the impact of the residential, commercial and industrial development, through ensuring that all development initiatives within 30 m of a watercourse are properly assessed as required under the *Fisheries Act* and its regulations.	• Protect riparian areas from the impact of the residential, commercial and industrial development, through ensuring that all development initiatives within 30 m of a watercourse are properly assessed as required under the *Fisheries Act* and its regulations. This also applies to wetlands.	• Protect riparian areas from the impact of the residential, commercial and industrial development, through ensuring that all development initiatives within 30 m of a watercourse are properly assessed as required under the *Fisheries Act* and its regulations.	• N/A

City of Chilliwack Official Community Plan (City of Chilliwack 1998)	• The purpose of this plan is to provide direction for future development, environmental protection, parks, transportation, recreation and service infrastructure. In addition, the plan will act as a policy guide to Council for short and long-term land use and development decisions, including associated social, economic, environmental and physical development.	• To undertake environmental protection and enhancement of steep slopes, viewscapes and other sensitive environmental features. • To integrate natural and rural landscape features within the City of Chilliwack • To restrict development within hazard areas. Buffer hazard lands from any form of development that will increase potential for erosion and surficial material movement.	• To protect viable, high quality, productive agricultural lands for long term agricultural use.	• Environmental protection, enhancement and remediation of creeks and riparian habitat. • Protect aquifers from surficial and groundwater pollution.	• To reduce GHG emissions. • Restrict open burning.	• N/A	• To undertake environmental protection, enhancement and remediation of creeks and riparian habitat. • Minimize disturbance of natural features along watercourses.	• Protect significant wetlands.	• Protect riparian areas	• N/A
Chilliwack District Sustainable Resource Management Plan (BC MFLNRO 2013e)	• This plan describes the approved landscape unit plans and legal OGMAs in the Chilliwack Forest District.	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A	• N/A	• Manage biodiversity through retention of old growth forests.	• N/A
City of Chilliwack Agricultural Area Plan (Don Cameron Associates 2012)	• The purpose of the Agricultural Area Plan is to define the City of Chilliwack's role with respect to agriculture and identify appropriate policies and actions to support the viability of farming. The plan emphasizes the City of Chilliwack's farm area, proposes solutions to issues, and identifies opportunities to strengthen farming.	• Generally enhance environmental protection and remediate sensitive environmental features.	• Create a centre of excellence for agriculture in Chilliwack. • Provide support to maximize agricultural industry sustainability. • Create a viable and enduring community by encouraging conservation and environmentally responsible practices.	• Generally enhance environmental protection and remediate creeks, riparian habitat and other sensitive environmental features. • To secure a water supply for ALR lands.	• To reduce the extent of open air burning on Chilliwack farms.	• N/A	• Generally enhance environmental protection and remediate creeks, riparian habitat and other sensitive environmental features.	• Generally enhance environmental protection and remediate sensitive environmental features.	• Generally enhance environmental protection and remediate riparian habitat and other sensitive environmental features.	• N/A
City of Abbotsford Official Community Plan (City of Abbotsford 2005)	• This plan is built on five major planning strategies intended to realize the vision of the city, including: creating a complete community; protecting our natural environment; building a healthy, inclusive community; making better connections; and strengthening the city centre.	• Prohibit land clearing, site grading, soil/rock removal or other works in areas designated as being within an Environmental Development Permit Area prior to obtaining an Environmental Development Permit. • Prohibit development on lands subject to subsidence, rock fall, debris flow or other natural hazard.	• Support and enhance the agriculture sector. • Prohibit land clearing, site grading, soil/rock removal or other works in areas designated as being within an Environmental Development Permit Area prior to obtaining an Environmental Development Permit. • Prohibit development on lands subject to subsidence.	• Protect the integrity of watercourses and riparian areas.	• To reduce GHG emissions and improve air quality.	• N/A	• Enhance fish and wildlife habitat connections and protect streams and riparian habitat in continuous systems by implementing the Streamside Protection Bylaw.	• N/A	• Protect riparian areas.	• N/A
Fraser Valley Regional District Official Community Plan for Popkum-Bridal Falls part of Electoral Area "D" (FVRD 1997)	• This is the background report to the OCP for Popkum-Bridal Falls, of the FVRD. The plan serves as a statement of the broad objectives and policies of the Regional board regarding the form and character of existing and future land use and servicing in the plan area. The plan has a number of purposes related to growth and development; land use and the provision of public services, protection of the environment, and implementing zoning and other bylaws.	• N/A	• Direct development away from farmland in the agricultural land reserve. • Protect agricultural land uses and ensure compatibility between adjoining residential and agricultural land uses.	• Effluents, whether domestic, agricultural or industrial, should not be permitted to enter any watercourse in the Plan area if they will impair the quality of the water. • Waste material should not be placed adjacent to a natural watercourse in such a way as to result in leachate or silt introduction to the watercourse via surface drainage or groundwater contamination.	• N/A	• N/A	• To avoid development near fish habitat whenever possible and, if development is necessary, following federal and provincial regulations.	• Protect natural wetlands.	• N/A	• N/A

		Element[1,2,3]

Fraser Valley Regional District Official Community Plan for Portions of Electoral Area "B" Yale, Emory Creek, Dogwood Valley and Choate Bylaw No.150, 1998 (FVRD 1198)	• The objectives of this plan relate to health protection, community enhancement, safe transportation, economic stability, natural hazard protection, heritage conservation, environmental conservation, compatible land use, community consultation and flexible implementation.	• Development shall be directed away from lands susceptible to slope instability, erosion, rockfall and other forms of geological and snow avalanche hazard.	• Lands which are susceptible to flooding, inundation or erosion should, wherever possible, be used for agricultural and other unintensive land uses.	• N/A	• N/A	• N/A	• Control access, development, and use of fish habitat in cooperation with the government. • Preserve watercourses with fish populations in as natural of a state as possible, unless they can be improved. • Avoid development near fish habitat including riparian wetlands, if possible, and , if development is necessary, following federal and provincial regulations.	• Avoid development near fish habitat including riparian wetlands, if possible, and , if development is necessary, following federal and provincial regulations.	• Preserve streamside vegetation of Yale Creek. • Preserve and maintain vegetation along railway to enhance aesthetics. • Leave a strip of natural vegetation along the watercourse when development occurs with a site-specific width.	• N/A
Fraser Valley Regional District Official Community Plan for Electoral Area "E" Bylaw No. 1115, 2011. (FVRD 2011)	• The objectives of this plan relate to: preserving scenic values; protecting habitat and water resources; encouraging residents as stewards of the environment; encouraging sustainable development, agriculture and recreation activities; and fostering the resiliency of rural and resort communities.	• N/A	• Promote agricultural viability and strengthen agriculture by providing flexibility in land uses and fostering sustainable practices. • The objective of Development Permit Area 5-E is to protect the natural environment, its ecosystems and biological diversity. More specifically, this DPA will protect streams and riparian habitat primarily through the involvement of qualified environmental professionals and the identification of Streamside Protection and Enhancement Areas (SPEAs) that should remain free of development, including the disturbance of soils.	• Activities or developments that may result in potential inputs to groundwater or substantial groundwater withdraws, or which could otherwise negatively affect the groundwater system, will require hydrological assessment to identify and mitigate impacts.	• To reduce GHG emissions.	• N/A	• Protect riparian habitat from development and enhance to improve habitat values where riparian vegetation has been degraded.	• N/A	• Protect scenic value of area by maintaining natural vegetation along the Columbia Valley Highway and Chilliwack Lake Road. • Protect riparian habitat from development and enhance to improve habitat values where riparian vegetation has been degraded.	• N/A
Regional Growth Strategy for the Fraser Valley Regional District (FVRD 2004)	• The purpose of the strategy is to provide support to the FVRD members as they continue to address growth management challenges. The vision is that the FVRD will be a network of vibrant, distinct and sustainable communities that accept responsibly managed growth while being committed to protecting the land resource and the natural environment to ensure that a high quality of life is accessible to all.	• N/A	• Support and enhance the agricultural sector. • Minimize land use conflicts between agricultural, recreational and urban uses. • Promote the reclamation of lands back to agricultural use, where appropriate.	• Protection of surface water. • To support ongoing monitoring and management of the region's groundwater supply through water conservation measures, nutrient management initiatives, Best Management Practices in industry and groundwater protection legislation. • To protect the region's potable surface and groundwater resources by supporting water conservation and stormwater management measures and by supporting the development of needed water protection legislation.	• Cooperate with appropriate jurisdictions to protect air quality.	• N/A	• No disturbance to riparian buffer from streams, watercourses and wetlands to protect water quality, hydrological functions and riparian habitat.	• No disturbance to riparian buffer from wetlands to protect water quality, hydrological functions and riparian habitat.	• Supporting watershed management plans which would include the management of large forested, vegetated areas and riparian corridors.	• N/A

Township of Langley Official Community Plan (Township of Langley 1979)	• The goals of this plan are to: attractively service urban areas providing diverse opportunities, suitable to the varied lifestyles in the municipality; maintain the rural character outside designated urban growth areas; preserve good quality air, water and land environments; rational development of agricultural, industrial and commercial enterprises to provide a balance between residential and other uses; provide adequate physical and social services within the means of the municipality; and to preserve and enhance the unique and character-defining aspects of Langley's historic sites, communities and cultural resources.	• To ensure development is controlled in all flood plain areas where a hazard exists. • To regulate development on steep slopes or in areas where there is landslide hazard, in order to prevent high damage costs in the case of ground movement.	• To enhance agricultural viability. • To protect agricultural lands from industrial encroachment.	• To encourage the enhancement of the aquatic environment of the rivers and creeks. • To enhance the natural amenities existing along the south bank of the Fraser River. • To protect watersheds which act as a natural landscape unit.	• To reduce GHG emissions. • Preservation of good air quality.	• N/A	• To encourage the enhancement of the aquatic environment of the rivers and creeks. • To enhance the natural amenities existing along the south bank of the Fraser River. • To protect watersheds which act as a natural landscape unit.	• N/A	• Identifying, conserving, restoring and enhancing corridors that connect streamside (riparian) habitat, upland habitat patches, and other green spaces where appropriate.	• N/A
Township of Langley Water Management Plan (Compass Resource Management Ltd. 2009)	• This plan provides a series of recommendations to better protect the aquifers in the Township of Langley from overuse and contamination.	• N/A	• Maintain native soils.	• To ensure safe and sustainable groundwater for the community for generations to come. Protect groundwater quality and quantity. • Reduce groundwater use (reduce demand, optimize supply) and enhance recharge areas. • Minimize risks from point and non-point source contaminants (nitrates, pesticides, and others). • Preserve baseflows in fish-bearing streams and minimize groundwater quality risks to fish bearing streams. • Maintain suitable baseflows and water levels in riparian and wetland areas and minimize contamination risks.	• N/A	• N/A	• Preserve baseflows in fish-bearing streams and minimize groundwater quality risks to fish bearing streams. • Maintain suitable baseflows and water levels in riparian and wetland areas and minimize contamination risks.	• Maintain suitable baseflows and water levels in riparian and wetland areas and minimize contamination risks.	• Maintain native soils and vegetation. • Promote healthy riparian and wetland habitats.	• N/A

City of Surrey Official Community Plan (City of Surrey 2012)	• This plan was adopted by the City of Surrey City Council to guide land use and development over the next 5 to 20 years. It is Council's intention to achieve orderly growth for complete sustainable communities with sensitivity to the environment. This growth includes residential growth as well as a growing business base for Surrey.	• Preserve and protect the natural environment.	• Preserve and protect the natural environment and agricultural land. • Protect and enhance agriculture within the agriculturally designated areas and maintain agricultural boundaries. • Encourage the development of effective buffers along the boundary of agriculturally designated land. • Encourage adjacent land uses to be compatible with existing farm use and ensure that the impacts (*e.g.* water runoff from upland areas) on agricultural lands will be minimized.	• Protect and enhance the aquatic environment. • Preserve ravines and watercourses in their natural state, and wherever possible, link them with green spaces to develop a continuous network of the natural environment throughout and between the developed areas of the City of Surrey. • Provide adequate control of sedimentation and erosion in runoff water during construction. • Attempt to maintain water quality, base flows and the natural flow pattern in any receiving watercourse to avoid flood damage and to protect aquatic biota (vegetation and wildlife) and habitats. • Manage the quality and quantity of stormwater runoff to help protect and enhance aquatic habitats.	• To reduce GHG emissions.	• N/A	• Protect and enhance the aquatic environment. • Preserve ravines and watercourses in their natural state, and wherever possible, link them with green spaces to develop a continuous network of the natural environment throughout and between the developed areas of the City of Surrey. • Identify and endeavour to protect Fisheries Sensitive Zones (instream aquatic habitats, out-of-stream habitat features: side channels, wetlands, riparian areas) as defined in conjunction with DFO, BC MOE and the City of Surrey.	• Preserve wetlands. • Identify and endeavour to protect Fisheries Sensitive Zones (wetlands) as defined in conjunction with DFO, BC MOE and the City of Surrey.	• A greener Surrey includes a connected network of protected natural ecosystems comprised of urban forests, riparian areas and wetlands, foreshore areas, grasslands and protected farmlands. • Preserve ravines and watercourses in their natural state, and wherever possible, link them with green spaces to develop a continuous network of the natural environment throughout and between the developed areas of the City of Surrey.	• N/A
City of Coquitlam Citywide Official Community Plan (City of Coquitlam 2001a)	• The purpose of this plan is to guide future land use and servicing provisions in ways that sustain its citizens' values. The plan provides a broader framework for considering and managing future change, including policies to implement the framework and address related needs for amenities, services and infrastructure support.	• To enhance the City's response to geotechnical and natural safety issues which could affect development and infrastructure. • To preserve hazard lands as environmentally significant areas. • To improve emergency response for addressing incidents involving natural hazards.	• Encourage retention of topsoil in new developments.	• To provide for effective and prudent management of the City of Coquitlam's watercourses through sustainable land use and development and other comprehensive watershed and stormwater management approaches.	• To reduce GHG emissions and improve air quality.	• N/A	• Riparian areas along watercourses shall be protected in accordance with standards which Council may approve by bylaw and through any necessary authorization by senior levels of government.	• N/A	• Recognize the benefits of vegetation and landscaping treatments in improving air quality, and regulating temperature. • Recognize the importance of vegetation in maintaining slope stability. • Continue to provide for safe tree retention, where appropriate. Review the existing Tree Cutting Permit Bylaw and Zoning Bylaw to ensure that any leave strips are not susceptible to tree falls.	• N/A

City of Coquitlam Citywide Official Community Plan (City of Coquitlam 2001a) (cont'd)	See above	See above	See above	See above	See above	• N/A	See above	• N/A	• In areas to be replanted, encourage the use of appropriate native vegetation. Native trees and plants provide habitat for birds and wildlife and are best suited to local soils and climate. • Riparian areas along watercourses shall be protected in accordance with standards which Council may approve by bylaw and through any necessary authorization by senior levels of government. • Minimized trail impacts on riparian corridors and other sensitive lands.	• N/A
Coquitlam Lougheed Neighbourhood Plan (City of Coquitlam 2001b)	• The purpose of the plan is to guide future land use and servicing decisions in ways that enhance the Lougheed Neighbourhood and to provide City Council with a plan to manage change in an efficient and effective manner. The plan is a comprehensive land use and servicing plan for lands within the City of Coquitlam that lie within an approximate 1.0 km radius of the Lougheed SkyTrain Station.	• Policies aiming to identify and preserve environmentally sensitive land, preserve and enhance the natural environment and areas of unique character, and aim to avoid and mitigate the impacts of urban development in hazardous lands, on lands of high environmental sensitivity.	• N/A	• Encourage new development to incorporate sustainable design features pertaining to water efficiency. • Encourage green infrastructure systems addressing water use, waste water and stormwater. • Maintain the Austin Creek drainage function in a manner that prevents further environmental degradation. • Ensure that new development conforms to the City of Coquitlam's Stormwater Management Policy and Design Manual.	• In general, to improve air quality.	• N/A	• Policies aiming to identify and preserve environmentally sensitive land and aim to avoid and mitigate the impacts near critical fish habitat.	• N/A	• Policies aiming to identify and preserve environmentally sensitive land, preserve and enhance the natural environment and areas of unique character, and aim to avoid and mitigate the impacts of urban development in hazardous lands, on lands of high environmental sensitivity, and near critical fish and wildlife habitat.	• N/A
Burnaby Official Community Plan (City of Burnaby 1998)	• The purpose of this plan is to provide direction for the growth management role that the city should play over the next 10 years and beyond. The goal of the plan is to create a more complete and livable community that reflects local needs, aspirations and values, and at the same time define Burnaby's contribution to helping shape a livable region for the next decade and beyond.	• N/A	• The long term protection of the lands within the ALR is an important objective in the City of Burnaby's overall planning framework. • To protect and enhance agricultural uses within the designated agricultural areas in the Big Bend.	• To Improve the quality of water runoff. • To achieve a zero net increase in runoff and avoid degradation of water flowing into the City of Burnaby's three major watersheds. • Adoption of the Burnaby Watercourse Bylaw which focuses on reducing contamination of stormwater and local waterways.	• In general, to improve air quality.	• Reduce operational noise at industrial sites.	• N/A	• N/A	• Adoption of an Integrated Pest Management Program which uses an ecological approach to vegetation and pest management on City of Burnaby properties. • Adoption of a Tree Protection and Replacement Bylaw. • Recognition that the developing system of Green Zone and other park lands in the City of Burnaby are to be protected and, as such, will not be available for accommodating any non-park uses in the future. • Preserving ecological continuity.	• N/A

Name of Plan	Summary of Plan	Element[1,2,3]

Watershed Management Plan (GVRD 2002)	• This plan is based upon the GVRD Board's overall vision statement, Creating Our Future, which states that the purpose of Greater Vancouver's watersheds is to produce clean, safe water. The Board's overall goal in this plan is to ensure that watersheds provide clean, safe water and are managed and protected as natural assets of the highest importance to the Greater Vancouver region.	• N/A	• To minimize the impact of soil erosion on the quality of the water entering the water distribution system.	• To provide clean, safe water. • Restoration of natural systems. • Support for natural processes consistent with water quality, safety and environmental quality. • Stewardship guided by research, monitoring and public involvement. • To verify that the watersheds will continue to provide an adequate supply of clean safe water for the water system.	• N/A	• N/A	• Preserve ecological functions for habitats and biodiversity. • Implement provincial fish strategies.	• Preserve ecological functions for habitats and biodiversity.	• Preserve ecological functions for habitats and biodiversity.	• N/A
Metro Vancouver 2040 – Shaping our Future (Metro Vancouver 2011)	• This plan focuses on land use policies to guide the future development of the region and support the efficient provision of transportation, regional infrastructure and community services. In combination with other management plans, Metro Vancouver's Regional Growth Strategy can help meet the region's priorities and mandates and support the long-term commitment to sustainability.	• Protect and enhance natural features and their connectivity. • Encourage land use that improves the ability to withstand natural hazard risks.	• Support agricultural uses within the ALR and, where appropriate, outside of the ALR. • Protect the supply of agricultural land. • Protect, enhance and restore ecologically important systems, features and corridors and establish buffers along agricultural lands and other ecologically important features.	• To protect natural features that support clean drinking water.	• Reduce GHG emissions and improve air quality	• N/A	• N/A	• Protect and enhance natural features and their connectivity. • Protect conservation and recreation lands.	• Protect and enhance natural features and their connectivity. • Protect conservation and recreation lands.	• N/A
Port Metro Vancouver Consolidated Land Use Plan 2010 (PMV 2010)	• This plan contains a comprehensive set of policies that will shape the way the PMV meets its objectives and fulfills its mandate under the Canada Marine Act. It facilitates the Port's obligation to manage the land and water within its jurisdiction in a manner that supports port activity while respecting the environment as well as the needs and interests of its neighbours. This plan also provides a tool for the Port to communicate land use policies and coordinate land use initiatives with neighbouring communities and external agencies.	• N/A	• N/A	• N/A	• Work on implementation of an air emissions strategic plan including new technologies to reduce air emissions. • Reduce GHG emissions.	• N/A	• Development of the most productive habitat areas in the Plan area is usually not permitted unless it is demonstrated that no alteration to or alienation of the habitat will occur.	• N/A	• Development of the most productive habitat areas in the Plan area is usually not permitted unless it is demonstrated that no alteration to or alienation of the habitat will occur.	• Exercise responsible environmental stewardship of PMV land and water areas so that growth and development takes place in an environmentally sensitive and sustainable manner. • Explore innovative environmental mitigation measures and strategies to minimize the environmental impacts of growth. • Maintain areas appropriate for environmental conservation and habitat enhancement within PMV.

Notes:
1 N/A means no applicable goals or objectives were found to be relevant to a given element.
2 Management objectives and guidelines for wildlife and wildlife habitat are discussed in Section 7.2.10.4.
3 Species at risk are discussed under the fish and fish habitat and vegetation columns of this table, and in Section 7.2.10.4 for wildlife species at risk.

8.0 CUMULATIVE EFFECTS ASSESSMENT

Cumulative effects are changes to the environment that are caused by an action in combination with other past, present and future human actions (Hegmann *et al.* 1999). A cumulative effects assessment is conducted to identify how impacts from a proposed project could interact with impacts from other developments occurring in the same ecosystem or region. A cumulative effects assessment expands the scope of traditional environmental assessment to evaluate how multiple activities may cause cumulative effects at both the local and regional scales (Finley and Revel 2002). In addition, a cumulative effects assessment differs from conventional project-specific environmental effects assessments by considering larger geographic study areas, longer time frames and unrelated projects or activities (Antoniuk 2002).

The scope of this cumulative effects assessment is a project-specific cumulative effects assessment as required under the *CEA Act*, *2012* which is appropriate for the scale of the Project. Project-specific cumulative effects assessments must determine if that particular project is incrementally responsible for adversely affecting a given element (Hegmann *et al.* 1999). They may also assist municipal, provincial and federal authorities by identifying requirements for additional planning, monitoring or mitigation that are beyond the direct control of the proponent and need to be implemented or led by others. Therefore, the total cumulative effect on a given environmental or socio-economic indicator must be identified; however, the cumulative effects assessment must also make clear to what degree the project under review is contributing to that total effect.

According to the *CEA Act, 2012,* a project-specific cumulative effects assessment need only focus on regional concerns where the principal project's activities may incrementally contribute to these concerns. Only those resources that are likely to be directly affected by the project under review, as well as other likely projects or activities, need to be included in the project-specific cumulative effects assessment.

The cumulative effects assessment evaluates the residual environmental effects directly associated with the Project (as identified in Section 7.0) in combination with reasonably foreseeable residual effects arising from other projects and activities that have been or will be carried out in the element-specific LSA or RSA of the Project. Future projects considered in the assessment do not include proposed or hypothetical projects where formal plans have not been disclosed.

8.1 Methodology

The Project cumulative effects assessment applies the following steps.

1. Identify potential residual effects of the Project (Section 8.1.1).
2. Determine spatial and temporal boundaries for each environmental indicator where residual effects have been identified for the Project (Section 8.1.2).
3. Identify existing activities and reasonably foreseeable developments with residual effects that may act in combination with the residual effects of the Project (Sections 8.1.3 and 8.1.4).
4. Identify potential cumulative effects (Section 8.1.5).
5. Develop technically and economically feasible mitigation measures (Section 8.1.6).
6. Determine the significance of the Project's contribution to cumulative effects (Section 8.1.7).

Each of the above steps is described below in the applicable methodology subsection. This cumulative effects assessment methodology has been developed primarily based on the CEA Agency's Cumulative Effects Assessment Practitioners Guide (Hegmann *et al.* 1999), the CEA Agency's Addressing Cumulative Environmental Effects under the *CEA Act, 2012* (CEA Agency 2013a), the *CEA Act, 2012* and the NEB *Filing Manual* (NEB 2013a). Additional guidance was also obtained from FEARO's The Authority's Guide to the *CEA Act*: Part II: The Practitioner's Guide (FEARO 1994a), FEARO's A Reference Guide for the *CEA Act*: Addressing Cumulative Environmental Effects (FEARO 1994b) and FEARO's A Reference Guide for the *CEA Act*: Determining Whether a Project is Likely to Cause Significant Environmental Effects (FEARO 1994c).

8.1.1 Identify Residual Effects of the Project

Scoping of the potential residual effects to be included in the cumulative effects assessment helps focus the cumulative effects assessment on issues that are non-trivial. While Hegmann *et al.* (1999), Hegmann, Eccles *et al.* (2002), Finley and Revel (2002) and Antoniuk (2000, 2002), among others, support the idea of narrowing the scope of issues to those of regional concern and a subset of Valued Ecosystem Components (VECs), Duinker and Greig (2006) recommend that project scale environmental assessment analyses should proceed on the assumption that all effects are cumulative. The latter statement reflects the expectations of the NEB, which are that each residual environmental effect is evaluated for potential cumulative effects (see Guide A.2.7 of the NEB *Filing Manual*). Nevertheless, Table A-2 of the NEB *Filing Manual* indicates that likely residual effects for the physical environment and GHG elements need not be subject to a cumulative effects assessment. Consequently, all other likely residual environmental effects for element-specific indicators identified in Section 7.0 are evaluated for potential cumulative effects, while those residual effects that are considered of regional concern are selected for more detailed analysis.

As per Guides A.2.6 and A.2.7 of the NEB *Filing Manual*, if a physical, biological or socio-economic element or indicator evaluated in the environmental effects assessment (Section 7.0) had no residual effects predicted or effects were not considered likely, then these elements or indicators were excluded from the cumulative effects assessment. Therefore, the cumulative effects assessment is limited to Project elements or indicators with residual effects that could act cumulatively with residual effects from other projects or activities.

8.1.2 Spatial and Temporal Boundaries

8.1.2.1 Spatial Boundaries

Defining appropriate spatial boundaries for potential cumulative effects is a critical step in the cumulative effects assessment. The selection of an excessively wide or large spatial boundary can cause any project-related cumulative effects to appear negligible compared to other actions (Hegmann *et al.* 1999) and increases the likelihood that an impact will be erroneously judged to be of no concern because it is relatively small in comparison (Antoniuk 2000, 2002, URS Corporation 2002).

Conversely, important regional and long-term effects may be overlooked if the spatial boundary is too small (Hegmann *et al.* 1999). An excessively small boundary may cause project-related cumulative effects to appear very significant compared to other activities within the study boundary, and potentially important issues outside the established boundary may be overlooked (Finley and Revel 2002). Antoniuk (2000, 2002) and URS Corporation (2002) note that the selection of a small study area prevents consideration of incremental and cumulative effects that are best evaluated over large areas. If boundaries are small, a more detailed or quantitative examination may be feasible; however, an understanding of the broad context may be sacrificed.

Spatial boundaries or zones of influence for pipeline-related effects are variable and may be based on a consideration of the local and regional environmental setting and any common connections or links that the pipeline project possesses with other activities or projects. As a result, different boundaries may be appropriate for different cumulative environmental effects (FEARO 1994b, Finley and Revel 2002). The spatial boundaries used in the Project cumulative effects assessment were areas where potential cumulative effects are non-trivial and have been identified. The spatial boundaries for each element as well as the rationale for the boundaries are presented in the respective subsection for each element in Section 7.0.

8.1.2.2 Temporal Boundaries

Current accepted practice for NEB applications is to use current conditions as the baseline for pipeline cumulative effects assessment (Antoniuk 2000, URS Corporation 2002). A general discussion of the historical developments and activities that have created the baseline is included as background information (Section 8.1.3).

The temporal boundaries used in the cumulative effects assessment include past development (up to the construction of the Project), the construction phase of the proposed development commencing in early 2016, and the operation phase that will commence following completion of construction and extending to the expected life of the Project (*i.e.*, 50+ years). Temporal boundaries identified for each element are presented in Sections 8.2 to 8.15.

8.1.3 Existing Activities and Events

Existing activities in the Project area will vary depending on the spatial boundaries identified for each specific environmental element.

Historical Context of Alberta

Aboriginal communities settled in Alberta about 8,000 years ago. European explorers came to Alberta in the mid-eighteenth century; however, European settlement at that time was discouraged by the Hudson’s Bay Company, which controlled the region for their fur trading activities. In 1870, the Hudson’s Bay Company turned over control of the entire northwest region, including present-day Alberta, to Canada. The area was subsequently opened to European settlement in 1872. Following construction of the Canadian Pacific Railway in 1881, settlement of Alberta rapidly increased. Alberta's population rose from 73,022 in 1901 to 584,454 in 1921. Most of the early settlers were ranchers in the arid southern region of the province, although the fertile soils of the central parkland region were suitable for agriculture and many settlers established grain farms (Stamp 2012). Settlement in the central Alberta foothills was influenced by extraction and processing of natural resources. The Town of Hinton developed as a result of coal mining in the early twentieth century, as well as the opening of a pulp mill in 1957 (Holmgren 2012).

By 1910, most of the available agricultural land in Alberta had been settled; however, many of these settlements were abandoned during the Great Depression and not resettled until the 1940s and 1950s. Although a trend toward urbanization was underway, rapid acceleration in this trend began following World War II, brought on by a shift in the economic base from agriculture to petroleum. This shift was initiated by the discovery of oil at Leduc in February 1947. The resulting development of oil and natural gas resources transformed the cities of Edmonton and Calgary into prosperous metropolitan centres: in 1946, 27% of Alberta's population lived in Edmonton and Calgary; by 2001 this had increased to 80.9% (Stamp 2012).

Historical Context of British Columbia

Occupation of BC by Aboriginal communities has been confirmed at about 6,000 to 8,000 years ago by carbon dating. The coastal people concentrated along the lower reaches of the major salmon rivers. They were a semi-sedentary people and developed an elaborate culture distinguished by totem poles and potlatches. Interior inhabitants developed a generally nomadic hunting and fishing culture adapted to the forested mountains, dry central interior and the riverine resources of the area.

The first permanent European settlement came with the development of the fur trade in the early nineteenth century. At mid-nineteenth century, the only non-native settlements in what was to become BC were fur trade posts on the coast, such as Victoria, Nanaimo and Fort Langley, and in the interior, such as Kamloops, Fort George (later Prince George) and Fort St. James.

This relatively quiet period of history ended in 1858 following the discovery of gold along the lower and middle reaches of the Fraser River, which led to an inland supply and transportation system along the Fraser River to the Cariboo Mountains. Thousands of prospectors journeyed to the region from California and other parts of the world. Mining became important in 1858 with the Fraser Gold Rush and later discoveries in the Cariboo region. Permanent mining towns began to establish along valleys of southeast BC by the 1880s, supported by local forestry, small farms and complex rail, road and water transport. In the early 1980s, mining in the area was highlighted by large, open-pit copper mines southwest of Kamloops. In contrast, settlement was more urban and commercial on the southwest coast.

Vancouver was selected as the site for the western terminal of the Canadian Pacific Railway in 1886, and it became the main port through which both coastal and interior products moved to world markets. Construction of the Grand Trunk Pacific Railway west from Edmonton through the upper Fraser, Bulkley and Skeena valleys from 1907 to 1914 was intended to give Canada a second gateway through the mountains to the Pacific coast.

Lumber mills were established in the southwest after the middle of the nineteenth century to supply the building needs of the growing settlements and to export to nearby Pacific settlements. The pulp and paper industry remained coastal until the mid-1960s, when mills were opened in several places across the interior. This interior expansion was part of the general spread of the forest industry into the interior of the province. Forestry was and continues to be an important economic pillar for the province, however, the industry has experienced considerable decline over recent years.

Farming began to supply the trading posts in BC in the mid-nineteenth century. The growing cities of Vancouver and Victoria stimulated agricultural expansion in the Fraser Valley and on Vancouver Island. In the 1890s, fruit and vegetable growing were established in the Okanagan and beef ranching in the Cariboo region. Agriculture brought settlers to the south-central interior. At the time of the Cariboo Gold Rush, ranching was established in the grassland valleys and rolling basins across the southern interior plateau. From 1966 to 1971, urban expansion was consuming over 6,000 ha per year of prime agricultural land. About 20% of the prime agricultural land of the Lower Fraser Valley and 30% of the Okanagan had already been converted when, in 1973, the *Land Commission Act* froze the disposition of agricultural land for non-agricultural use, despite competing demands for housing, industry, hobby farms and country estates.

Steep, rugged geography and high precipitation make many areas of BC suitable for hydroelectric power generation. Hydroelectric power was first produced at the close of the nineteenth century from small rivers in the southwest for urban consumers in Victoria and Vancouver. The largest single power site in the southwest prior to 1940 was developed on Bridge River, just east of the Coast Mountains.

Early in the nineteenth century, salmon canneries were dispersed all along the BC coast. However, the gradual introduction of improved boats with longer ranges and refrigeration resulted in the closing of most canneries on the central coast, and fish processing was concentrated into a few large plants near Prince Rupert and Vancouver.

Coastal BC was, and still is, served by an extensive ferry service which moves freight, cars and passengers across the Strait of Georgia. Small coastal boats, tugs and barges move natural resources, supplies and people along the sheltered "Inside Passage" between Vancouver Island and the mainland of BC, and northward to Prince Rupert, Haida Gwaii and the Alaska Panhandle.

By the mid to late twentieth century, thousands of Canadians migrated to BC, attracted by the mild climate and perceived economic opportunities, joining thousands of other immigrants from Asia. In the twenty-first century, BC is now one of Canada's most prosperous and fastest growing provinces in part due to its diverse natural resource industry and, in particular, the more recent growth and development of the natural gas sector in the northeast of the province. However, the population has always been primarily urban - in 2001, 84.7% was classified as urban, with most people residing in the southwest region (Robinson 2012).

8.1.3.1 Alberta (Edmonton to Hinton)

The economic base of the City of Edmonton and area (*i.e.*, Strathcona, Parkland, Lac Ste. Anne, Sturgeon, Brazeau and Leduc counties) is diverse and has expanded from a provincial government and regional commercial centre to include agriculture, biofuels, chemicals and petrochemicals, commercial/retail, residential, forestry and related industries, infrastructure, institutional, mining, oil and gas, oil sands, other industrial, pipelines, power, and tourism and recreation. In 2011, the most active industries in the City of Edmonton (by industrial classification) were: retail trade (employing approximately 12% of the labour force); health care and social assistance (11%); and construction (8%) (Statistics Canada 2013).

West of the City of Edmonton and surrounding municipalities in Yellowhead County, the economy is more resource-based. Key sectors include forestry, coal, oil and gas, agriculture and tourism. Forestry and coal mining are in flux, but the oil and gas industry is a steady contributor to the economy within Yellowhead County (Lyons pers. comm.). Within Yellowhead County, the most active industries (by industrial classification) in 2011 were: mining, quarrying, and oil and gas extraction (employing approximately 17% of the labour force); retail trade (11%); construction (8%); and accommodation and food services (8%) (Statistics Canada 2013).

The Socio-Economic Technical Report (Volume 5D) provides additional information on employment and economy of counties and communities in the various RSAs along the proposed pipeline corridor.

Natural Disturbance

Natural disturbance in various RSAs in Alberta commonly results from: forest fires; forest pests, particularly the mountain pine beetle west of the Town of Edson; and flooding, particularly along the North Saskatchewan, Pembina and McLeod rivers.

Settlement Patterns

In 2011, the total population of the City of Edmonton and surrounding counties (*i.e.*, Strathcona, Parkland, Lac Ste. Anne, Sturgeon, Brazeau and Leduc counties) was 1,188,962; a 12% increase from 2006. The median age of people in this urbanized region was 37 and 5.5% of the population identified as Aboriginal (Statistics Canada 2012a).

In 2011, the total population of Yellowhead County was 29,336; a 3.5% increase from 2006. The median age of people in the county was 43.5 and 11.5% of the population identified as Aboriginal (Statistics Canada 2012a).

The Socio-Economic Technical Report (Volume 5D) provides additional census information on population and demographics of counties and communities in the various RSAs along the proposed pipeline corridor.

Agriculture and Livestock Grazing

Agricultural production is the primary land use in the RSAs throughout Strathcona and Parkland counties, and eastern regions of Yellowhead County (Parkland County 2007, Strathcona County 2007, Yellowhead County 2006), and continues to be supported by regional municipalities. For example: a policy of the Parkland County Municipal Development Plan (MDP) is to preserve the integrity of productive agricultural areas and the conservation of agricultural land (Parkland County 2007); a goal of the Yellowhead County MDP is to concentrate future development in areas that do not fragment existing agricultural land (Yellowhead County 2006); and an objective of the Strathcona County MDP is to maintain and enhance the viability of the existing agricultural community and agricultural industry (Strathcona County 2007).

The dominant type of agricultural activity in Strathcona County by number of reporting farms is other animal production, followed by other crop farming, hay farming, and horse and other equine production (182 farms, 159 farms, 154 farms, and 141 farms, respectively) (Statistics Canada 2012b). Agricultural land use in Strathcona County is predominantly crops, followed by natural land for pasture and tame or seeded pasture (60,759 ha, 13,355 ha, and 7,914 ha, respectively) (Statistics Canada 2012b).

The dominant type of agricultural activity in Parkland County by number of reporting farms is beef cattle ranching and farming, followed by hay farming, horse and other equine production, and other grain farming (219 farms, 148 farms, 140 farms, and 61 farms respectively) (Statistics Canada 2012c). Agricultural land use in Parkland County is predominantly crops, followed by tame or seeded pasture, and natural land for pasture (73,051 ha, 35,367 ha, and 34,983 ha respectively) (Statistics Canada 2012c).

The dominant type of agricultural activity in Yellowhead County by number of reporting farms is beef cattle ranching and farming, followed by hay farming, horse and other equine production and animal combination farming (205, 183, 135, and 43 farms respectively) (Statistics Canada 2012d). Agricultural land use in Yellowhead County is predominantly natural land for pasture, followed by crops, and tame or seeded pasture (65,379 ha, 62,913 ha and 34,372 ha, respectively) (Statistics Canada 2012d).

Crown-owned grazing leases also are present within the RSAs. These grazing leases are broadly managed by Alberta Environment and Sustainable Resource Development (AESRD), although individual land users are responsible for the day-to-day management of the land.

Forestry

The volume of timber harvested in Forest Management Agreements (FMAs) along the proposed pipeline corridor provide an indication of current forestry activity in the various RSAs.

Effective in 2007, the approved Annual Allowable Cut (AAC) for the Weyerhaeuser Company Ltd. (Edson) (Weyerhaeuser) FMA is 514,856 m^3 of coniferous wood and 328,663 m^3 of deciduous wood, up from an approved AAC in 2006 of 384,363 m^3 for coniferous and 317,440 m^3 for deciduous. As of 2007, no mountain pine beetle was detected in the Weyerhaueser FMA; however, the increase in AAC is part of Weyerhaeuser's 20-year plan to create a forest that is more resistant to such outbreaks by dramatically reducing the overall susceptibility of pine forests in the FMA (Weyerhaeuser 2008a).

The approved AAC for the West Fraser Mills Ltd. (Hinton) (West Fraser) FMA is 1,766,576 m^3 of coniferous wood and 249,832 m^3 of deciduous wood, up from an approved AAC of 1,535,000 m^3 for coniferous and 169,449 m^3 for deciduous from 2008 to 2010. The West Fraser FMA is in the leading edge zone for mountain pine beetle, where the increase in AAC for coniferous wood is part of the strategy to eradicate all mountain pine beetle infestations as they become known (West Fraser 2010).

Recreation

Outdoor recreational activities such as snowmobiling, cross-country skiing, all-terrain vehicle (ATV) use, mountain biking, hiking, camping, rafting, kayaking, canoeing and sight-seeing are expected to occur within various RSAs along the proposed pipeline segment. Recreational boating and fishing occurs on the larger watercourses (*e.g.*, North Saskatchewan, Pembina and McLeod rivers) and lakes (*e.g.*, Wabamun Lake).

The Socio-Economic Technical Report (Volume 5D) provides additional information on recreation activities in the various RSAs along the proposed pipeline corridor.

Rural and Urban Residential and Commercial

The proposed pipeline corridor crosses urban and rural commercial and residential centres including the City of Edmonton, City of Spruce Grove, Town of Stony Plain, Town of Edson, Town of Hinton, as well as three Hamlet Growth Areas within Yellowhead County: Niton Junction (approximately RK 187); Wildwood (approximately RK 151); and Evansburg (approximately RK 137). The Yellowhead County MDP notes that these Hamlet Growth Areas have a 3 km radius around existing hamlets and provide space to accommodate new development (Yellowhead County 2006).

The City of Edmonton surrounding communities (*e.g.*, City of Spruce Grove, Town of Stony Plain) have experienced rapid population growth over the past 5 years (refer to the Socio-Economic Technical Report of Volume 5D). As a result, residential development within the City of Edmonton surrounding communities has also increased, with the largest residential housing market located in the City of Edmonton.

In the more rural area of Yellowhead County, communities experienced rapid growth in 2007/2008, during the last oil and gas boom. Since that time, growth has declined and, as a result, residential development overall within Yellowhead County has also declined.

The Socio-Economic Technical Report (Volume 5D) provides additional details on rural and urban residential development in counties and communities in the various RSAs along the proposed pipeline corridor.

Transportation and Infrastructure

Current and ongoing transportation activities in the RSA for various elements may include regular and commercial vehicle traffic, as well as maintenance activities on roads, bridges, highways, railways and airports.

According to approximately five permanent traffic measurement sites located on Highway 16 within the City of Edmonton and Parkland County, overall Monthly Average Daily Traffic (MADT) volumes have increased from 2009 to 2011, with larger volumes occurring close to the City of Edmonton. This is likely due to commuters driving to Edmonton from the City of Spruce Grove and the Town of Stony Plain (Alberta Transportation 2012).

There are four permanent traffic measurement sites located on Highway 16 within Yellowhead County. Overall MADT volumes have increased from 2009 to 2011, with larger volumes occurring close to the

Town of Edson and the Town of Hinton, likely due to commuters. Throughout Yellowhead County, MADT volumes are highest during the summer months (Alberta Transportation 2012).

The Socio-Economic Technical Report (Volume 5D) provides additional information on transportation and infrastructure, including traffic volume measurements, at various locations in vicinity to the proposed pipeline corridor.

Utility Activities

Current and ongoing utility activities in the RSA for various elements include maintenance on transmission line and gas distribution rights-of-way (*e.g.*, ATCO Gas and Pipelines Ltd. [ATCO Gas], EPCOR Distribution and Transmission Inc. [EPCOR]) as well as operational activities at thermal electric power generating plants, such as the TransAlta Corp. (TransAlta) Sundance and Keephills thermal electric power generating plants approximately 6 km southwest and 12 km south of Wabamun, respectively (TransAlta 2013a).

In addition, three major transmission line developments are currently under construction in the various RSAs; the AltaLink Management Ltd. (AltaLink) Western Alberta Transmission Line Project, EPCOR and AltaLink Heartland Transmission Project and ATCO Electric Ltd. (ATCO Electric) Eastern Alberta Transmission Line Project (see Section 8.1.4.1 for additional details).

Oil and Gas

As home to Canada's largest oil refining complex and North America's third largest petrochemical complex, Strathcona County's economic base is oil and gas. The county supports oil and gas exploration and development with the least possible impact on the environment, health, safety and quality of life for residents and the community (Strathcona County 2007). Likewise, one of the main industries in Parkland and Yellowhead counties is oil and gas exploration and development.

Oil and gas activity in the RSAs for various elements has been ongoing since the 1950s. Oil and gas exploration and development activities conducted over the years include seismic operations and the construction and operation/maintenance of pipelines, access roads and lease sites (*e.g.*, wells, gas plants, compressor stations).

Mineral Resources

Ongoing mining operations in the various RSAs include aggregate quarries and coal mines. The TransAlta Highvale Mine located approximately 10 km southwest of Wabamun delivers coal to TransAlta's Sundance and Keephills thermal generating plants (see Utility Activities above) (TransAlta 2013b). The Whitewood Mine, located approximately 8 km north of Wabamun Lake, was closed in 2010 and TransAlta is now focused on reclaiming the former coal mine (TransAlta 2013c). The Teck Resources Ltd. (Teck) Cardinal River Mine approximately 40 km south of Hinton produces mostly metallurgical coal (Teck 2013a), while the Sherritt International Corporation (Sherritt) Coal Valley Mine approximately 60 km south of Edson produces mostly thermal generating coal for international export (Sherritt 2013). Two other coal mines operated by Sherritt — Gregg River Mine and Obed Mountain Mine located south and northeast of Hinton, respectively — are currently inactive (Sherritt 2013).

8.1.3.2 British Columbia (Hargreaves to Westridge)

The economic base of the Regional District of Fraser-Fort George (RDFFG) and Thompson-Nicola Regional District (TNRD) includes forestry and wood products, agriculture, tourism and government services. For both regional districts overall, the most active industries (by industrial classification) in 2011 were: retail trade (employing approximately 12% of the labour force); health care and social assistance (12%); accommodation and food services (8%); and construction (8%) (Statistics Canada 2013).

The economy of the Fraser Valley Regional District (FVRD) is based primarily on agriculture, manufacturing and construction. Historically, the predominant sectors have been agriculture and resource development, including forestry, however, the economy is diversifying based on growth in the manufacturing, services, aerospace and technology sectors (FVRD 2010). For the FVRD overall, the most active industries (by industrial classification) in 2011 were: retail trade (employing approximately

13% of the labour force); health care and social assistance (12%); construction (11%); and manufacturing (10%) (Statistics Canada 2013).

The economic base of Metro Vancouver is diverse and includes trade and commerce, manufacturing, goods distribution, professional services, tourism, education and agriculture. For Metro Vancouver overall, the most active industries (by industrial classification) in 2011 were: retail trade (employing approximately 10% of the labour force); health care and social assistance (10%); accommodation and food services (8%); and professional, scientific and technical services (9%) (Statistics Canada 2013).

The Socio-Economic Technical Report (Volume 5D) provides additional information on employment and economy of regional districts and communities in the various RSAs along the proposed pipeline corridor.

Natural Disturbance

Natural disturbance in various RSAs within BC commonly result from forest fires (mainly interior BC); forest pests (mainly interior BC), particularly the mountain pine beetle, but also the balsam bark beetle, Douglas-fir bark beetle, western spruce budworm and aspen leaf miner; debris slides and flows, particularly between the Village of Valemount and District of Clearwater, as well as the City of Merritt and District of Hope; avalanches along the Coquihalla River valley; and flooding, particularly along the North Thompson, Thompson, Coldwater, Coquihalla and lower Fraser rivers.

Settlement Patterns

Key incorporated population centres in the RDFFG and TNRD along the proposed pipeline corridor include the Village of Valemount, the District of Clearwater, the City of Kamloops, the City of Merritt and the District of Barriere, as well as many small, unincorporated communities such as Blue River, Vavenby, Avola and Little Fort. In 2011, the total combined population of electoral areas, communities and Indian Reserves (IRs) along and in vicinity to the proposed pipeline corridor in the RDFFG and TNRD was 128,978; a 4.6% increase from 2006. In 2011, the median age was 45 and 10.6% of the population identified as Aboriginal (Statistics Canada 2012a).

The FVRD is largely agricultural, and key incorporated municipalities include the District of Hope, the City of Chilliwack and the City of Abbotsford. In 2011, the total combined population of electoral areas, communities and IRs along and in vicinity to the proposed pipeline corridor in the FVRD was 274,404; an 8% increase from 2006. In 2011, the median age was 42.6 and 6.4% of the population identified as Aboriginal (Statistics Canada 2012a).

In 2011, the total population of Metro Vancouver, which includes the cities of Surrey, Coquitlam, Burnaby and Vancouver, was 2,313,328; a 9.3% increase from 2006. In 2011, the median age of the population in Metro Vancouver was 41 and 2.4% of the population identified as Aboriginal (Statistics Canada 2012a).

The Socio-Economic Technical Report (Volume 5D) provides additional census information on population and demographics of electoral areas and communities in the various RSAs along the proposed pipeline corridor.

Agriculture and Livestock Grazing

Limited agricultural activities in the various RSAs north of Kamloops consist predominantly of grazing areas and permanent pastures near Valemount, Blue River, Avola and Clearwater. Beyond Clearwater to the southwest, the river valley widens and the land use in the valley bottom is mainly pasture and forest grazing. Natural grazing lands are common along the Coquihalla Highway from the area south of Kamloops to south of Merritt, where forest begins to dominate from south of the Coquihalla Lakes to Hope.

The Agricultural Land Reserve (ALR) in the TNRD accounts for less than 13% of the overall area of the regional district. The dominant types of agricultural activity in TNRD are classified as unmanaged pasture and managed pasture at 79% and 10%, respectively. Crops, mainly alfalfa and other fodder crops, account for 7% (BC Ministry of Agriculture and Lands 2008).

Two-thirds of the land base in the City of Chilliwack is reserved for agriculture, which is dominated by dairy, poultry, nurseries and greenhouses (City of Chilliwack 2012). Approximately 75% of the Township of Langley is classified as ALR, which is utilized for a variety of purposes, including greenhouses, nurseries, berry operations, equestrian farms, wineries, poultry farms and vegetable farms (Township of Langley 2013). The City of Abbotsford is one of the most intensively and diversely farmed areas in Canada, supporting a wide range of crop and livestock enterprises (City of Abbotsford 2011). Agriculture is also a predominant land use activity in the City of Surrey, where approximately 8,692 ha of the city's total area is classified as ALR, of which approximately 5,864 ha is used for agriculture production (City of Surrey 2013a).

Further northwest into the cities of Coquitlam and Burnaby, agricultural land uses are almost entirely absent due to the presence of higher density urban development, mountainous terrain and protected areas.

Forestry

The volume of timber harvested in Timber Supply Areas (TSAs) along the proposed pipeline corridor provide an indication of current forestry activity in the various RSAs. Of an AAC of 536,000 m^3, only 146,179 m^3 was harvested in the Robson Valley TSA, up from a low of 50,086 m^3 in 2009. Due to recent closures of lumber mills in McBride and Valemount, the Robson Valley TSA is generally a source of timber for Carrier Lumber in Prince George and Canfor in Vavenby (BC Ministry of Forests, Lands and Natural Resource Operations [MFLNRO] 2012a). Of an AAC of 4 million m^3, only 2.87 million m^3 was harvested in the Kamloops TSA, up from a low of 1.7 million m^3 in 2009 (BC MFLNRO 2012b). Every year from 2007 to 2011, the Merritt TSA recorded harvest rates greater than AAC rates, at approximately 118% over the 5-year period, due to pine beetle management activities. The greatest disparity was in 2011, when 3.38 million m^3 was harvested, compared to the AAC of 2.4 million m^3.

More recent AAC and harvest information for the Fraser TSA were not available; however, the current AAC of 1.27 million m^3 provides an indication that the Fraser TSA is experiencing some degree of active timber harvesting. The AAC is projected to stay at 1.27 million m^3 until the next AAC determination prior to August 1, 2014 (BC MFLNRO 2013a).

Active timber harvesting also occurs in several community forests within the various RSAs, including the Valemount Community and McBride Community forests.

Recreation

Outdoor recreational activities within various RSAs along the proposed pipeline corridor include snowmobiling, heli-skiing, cross-country skiing, ATV use, mountain biking, hiking, horseback riding, camping, golfing, rafting, kayaking, canoeing and sight-seeing. Recreational boating and fishing occurs on the larger watercourses (*e.g.*, Fraser, North Thompson, Thompson, Nicola, Coldwater and Coquihalla rivers) and lakes (*e.g.*, Kamloops, Jacko, Nicola and Coquihalla lakes).

The Socio-Economic Technical Report (Volume 5D) provides additional information on recreation activities in the various RSAs along the proposed pipeline corridor.

Rural and Urban Residential and Commercial

The proposed pipeline corridor crosses various types of residential land use, from rural parcels with residences to urban centres such as the City of Kamloops, City of Chilliwack, City of Abbotsford, Township of Langley, City of Coquitlam and the City of Burnaby.

Most communities along the proposed pipeline corridor in the RDFFG and TNRD have experienced average population growth from 2006 to 2011. As a result, residential development within the regional districts has also remained consistent. The demand for housing for communities along the proposed pipeline corridor in the FVRD has expanded with population and economic growth. Close proximity to Metro Vancouver is a factor in the region's increased demand for housing, although the FVRD generally has more affordable housing than Metro Vancouver (FVRD 2011). The private housing market in the Greater Vancouver area has seen low sales activity in 2012; below historical averages (Real Estate Board of Greater Vancouver [REBGV] 2013). In Metro Vancouver, home prices have declined 2.8% since January 2012 (REBGV 2013).

Refer to the Socio-Economic Technical Report (Volume 5D) for additional details on rural and urban residential development in regional districts and communities in the various RSAs along the proposed pipeline corridor.

Transportation and Infrastructure

Current and ongoing transportation activities in the RSA for various elements may include regular and commercial vehicle traffic, as well as maintenance activities on roads, bridges, highways, railways and airports.

There are three permanent traffic measurement sites located along Highway 5: north of the Village of Valemount; west of the City of Kamloops; and north of the District of Hope. Traffic count data are available for 2010, 2011 and 2012 for these sites. Overall between the three sites, MADT volumes have remained relatively consistent from 2010 to 2012. At all three sites, MADT volumes are highest during the summer months likely due to travel associated with tourism and recreation: north of the Village of Valemount, 2012 MADT volumes ranged from a low of 1,413 in January to a high of 3,977 in July; west of the City of Kamloops, 2012 MADT volumes ranged from a low of 5,412 in January to a high of 13,537 in August; and north of the District of Hope, 2012 MADT volumes ranged from a low of 5,456 in January to a high of 18,476 in August (BC Ministry of Transportation and Infrastructure 2012).

Three permanent traffic measurement sites are located on Highway 1 between the District of Hope and City of Abbotsford: west of Hope; and within the cities of Chilliwack and Abbotsford. Traffic count data are available from 2010 to 2012 for the Hope and Abbotsford sites and 2012 for the Chilliwack site. Overall MADT volumes have remained consistent from 2010 to 2012, with larger volumes occurring in the cities of Chilliwack and Abbotsford (likely due to commuters moving between communities). The permanent traffic measurement sites on Highway 1 west of Hope is considered seasonal, as evidenced by the difference in monthly average daily traffic between winter and summer months. Increased traffic during summer months is likely due to travel associated with tourism and recreation. The permanent traffic measurement sites on Highway 1 in Chilliwack and Abbotsford are relatively consistent, with more modest variations in MADT between winter and summer months.

There are four permanent traffic measurement sites located on Highway 1 in vicinity to the proposed pipeline corridor within Metro Vancouver. Traffic count data are available for 2010 for these sites and, in some cases, 2011 and 2012 as well. Overall MADT volumes have remained consistent from 2010 to 2012, with larger volumes occurring at the Port Mann Bridge crossing (likely due to commuters driving between communities in Metro Vancouver). The permanent traffic measurement sites on Highway 1 are considered consistent, with little difference in MADT between winter and summer months.

The Socio-Economic Technical Report (Volume 5D) provides additional information on transportation and infrastructure, including traffic volume measurements, at various locations in vicinity to the proposed pipeline corridor.

Utility Activities

Current and ongoing utility activities in the RSA for various elements include maintenance on transmission line, fibre optic line and gas distribution rights-of-way (*e.g.*, BC Hydro, Telus Communications Corp. [Telus], FortisBC Energy Inc. [FortisBC]) as well as operational activities at run-of-river hydroelectric plants, including Brookfield Renewable Power Inc. (Brookfield) East Twin Creek, located approximately 22 km northwest of McBride; Hauer Creek Power Ltd. Hauer Creek, located approximately 15 km northwest of Valemount; Brookfield Hystad Creek, located approximately 6 km west of Valemount; TransAlta Bone Creek, located approximately 20 km northeast of Blue River; and Boston Bar Hydro Scuzzy and Six Mile creeks, located approximately 55 km north of Hope (BC Hydro 2013a).

Other ongoing and current utility activities include operation and maintenance activities associated with public utilities and services (*e.g.*, water and sewer lines, landfills), electric substations and waste-to-energy facilities, such as Metro Vancouver's Waste-to-Energy Facility located in the City of Burnaby, which is responsible for the environmentally safe disposal of over 25% the region's waste (Metro Vancouver 2013), and MAXIM's 7.4 MW electrical and 9.1 MW thermal landfill gas cogeneration project in Delta, BC (MAXIM 2013).

In addition, major utility developments currently under construction in the various RSAs include the BC Transmission Corporation Interior – Lower Mainland Transmission Project and the BC Hydro Merritt Area Transmission Project (see Section 8.1.4.2 for additional details).

Oil and Gas

There are currently no oil and gas exploration and development activities within any RSAs in BC. There are, however, existing oil and gas transportation and storage developments such as the existing TMPL system and associated facilities, the Suncor Energy Corp. (Suncor) Products Partnership Terminal at the Kamloops Airport and the FortisBC Kingsvale Compressor Station. The Kingsvale Compressor Station serves a Spectra Energy Corp. pipeline that originates in northern BC within the various RSAs and extends from the Kingsvale area to the Lower Mainland via a route through Prince George, Cache Creek and the Coquihalla River valley.

Mineral Resources

Ongoing mining operations in the various RSAs include aggregate quarries and metal mines. The New Gold Inc. (New Gold) New Afton Mine is an underground and open-pit copper-gold mine located approximately 10 km west of the City of Kamloops that began production in June 2012 (New Gold 2013). Located approximately 50 km southwest of Kamloops, the Teck Highland Valley Copper Mine produces copper and molybdenum concentrates, and is one of the largest open-pit mining operations in BC (Teck 2013b).

Exploration activities (*e.g.*, sample drilling) are currently underway in various RSAs along the proposed pipeline corridor. Mining activities identified in the various RSAs in the exploration phase include the proposed Imperial Metals Corp. Ruddock Creek Zinc-Lead Mine Development Project near Avola, the proposed Discover Corp. Enterprises Inc. Galaxy Mine near Kamloops, the proposed Strongbow Exploration Inc. Shovelnose Mine near the City of Merritt, the proposed Gold Mountain Mining Corp. Elk Gold Mine near Merritt and the proposed New Carolin Gold Corp. Ladner Gold Project near Hope.

Marine Commercial, Recreational and Tourism Use

Although regulation and authorization of marine transportation is not specifically within the jurisdiction of the NEB, the environmental and socio-economic effects of the increased marine traffic is considered by Trans Mountain in accordance with the NEB's direction from their List of Issues for the Project, released on July 29, 2013.

The City of Vancouver, which bounds most of the southern shore of Burrard Inlet, is Canada's third largest city and its busiest port (Port Metro Vancouver [PMV] 2013a). Fishing vessels use Burrard Inlet to berth, fuel, and to access fishing grounds. Commercial fishers in Burrard Inlet mainly target Dungeness crab, prawn and shrimp. A small commercial fishery for surf smelt takes place in Burrard Inlet, mostly off spawning beaches in English Bay (Fisheries and Oceans Canada [DFO] 2013).

Under the *Canada Marine Act*, the PMV is mandated as the port authority responsible for the safe and efficient movement of marine vessel traffic in Burrard Inlet. The PMV provides oversight for operations of 28 major cargo and container terminals, 23 of which are in Burrard Inlet (PMV 2013a). The Outer Harbour and eastern area of the harbour contain multiple commercial anchorages for large deep draft marine vessels. The Inner Harbour is heavily industrialized, containing several major marine cargo, container and cruise ship terminals (PMV 2010).

The SeaBus commuter ferry travels between Vancouver and North Vancouver in the Inner Harbour, from Coal Harbour to Lonsdale Quay. In 2011, an average of 23,020 passengers used the SeaBus weekly (TransLink 2013a). In addition, a seaplane base is located in Coal Harbour. The area has one of the highest levels of seaplane activity in the world and is rated as one of the busiest aerodromes in Canada, with a total of 8 destinations serviced by a fleet of 30 planes (Global Aviation Resource 2010).

The Central Harbour continues east of the Second Narrows and contains marine terminals including the Westridge Marine Terminal, as well as the Chevron Refinery (PMV 2013a). Marine terminals are also present in Port Moody Inlet, east of the Westridge Marine Terminal.

Log handling occurs in Burrard Inlet and along the Fraser River. Mill & Timber Products in Port Moody handles and stores logs in Port Moody Inlet (Natland pers. comm.). Logs are also stored in numerous locations along the Fraser River. A log pond area is active in nearshore areas south of Point Grey in Vancouver. Many of these logs stored on the river are processed at the remaining mill sites along the river (Natland pers. comm.).

Commercial anchorages are located in the central harbour around the Westridge Marine Terminal, in the Inner Harbour and the Outer Harbour. Some anchorages are designated for different purposes, such as short-term use, emergency use, or for outbound vessels only (PMV 2012).

Marine recreation in Burrard Inlet is both intense and diverse, including fishing, boating, kayaking, paddle boarding, windsurfing and kite boarding, swimming, and scuba diving. Recreational users also access major destinations through Burrard Inlet; notably Indian Arm, where provincial and regional parks cover much of the shoreline.

Vancouver is the home port for the Vancouver–Alaska cruise ship industry, with two cruise ship terminals in the Inner Harbour that provide berthing facilities for 14 cruise ship companies (PMV 2013a). Over 800,000 passengers are expected to pass through one of the two cruise terminals in Vancouver Inner Harbour in 2013 (Cruise Lines International Association 2013). Local charter companies based in the Vancouver area offer boat tours and corporate and private cruises on large yachts in Vancouver Harbour, including the Inner Harbour and Indian Arm (Destination BC 2013, Harbour Cruises 2013).

8.1.4 Reasonably Foreseeable Developments

Reasonably foreseeable developments that are likely to occur in the Project area will vary depending on the spatial boundaries identified for the specific socio-economic element.

The criteria used to determine projects that may act cumulatively with the Project are:

- certain – the physical activity will proceed or there is a high probability it will proceed (*i.e.*, the project is either under construction, has been approved or is in the process of obtaining approval); or
- reasonably foreseeable – the physical activity is expected to proceed (*i.e.*, the project proponent has publicly disclosed its intention to seek the necessary approvals to proceed).

Sources reviewed to identify any projects/activities that could have cumulative interactions with the Project include: Alberta Inventory of Major Projects (Alberta Enterprise and Advanced Education [AEAE] 2013); BC Major Projects Inventory (BC Ministry of Jobs, Tourism and Skills Training and Responsible for Labour [MJTST] 2012); Alberta Transportation (2013a,b); Alberta Energy Regulator (AER, formerly Alberta Energy Resources Conservation Board [ERCB]) (ERCB 2013a); Alberta Utilities Commission (AUC) (2013a); BC Utilities Commission (2013); BC Oil and Gas Commission (BC OGC) (2013); BC Land Tenure Branch (BC MFLNRO 2013b); BC Environmental Assessment Office (EAO) (Province of BC 2013); PMV (2013b); CEA Registry (CEA Agency 2013b); NEB (2013b); Canada's Economic Action Plan (Government of Canada 2013a); Major Projects Management Office (Government of Canada 2013b); and county, regional district and municipality websites.

Other activities and reasonably foreseeable developments included in the assessment were identified as of May 31, 2013 and are summarized in the subsections below and in Appendix 8.1. Only those certain and reasonably foreseeable future developments with identified footprints outside of urban disturbed areas are mapped and included in Tables 8A.1-1 to 8A.1-4 of Appendix 8.1 and Figures 8.1-1a, 8.1-1b and 8.1-1c. Reasonably foreseeable developments summarized in Table 8A.1-5 (for Alberta) and Table 8A.1-6 (for BC) of Appendix 8.1 with the potential to act in combination with the Project were excluded from mapping since development details (*e.g.*, approval status, location) were either not available or the developments were located within urban municipal boundaries, such as the City of Edmonton and Lower Mainland Developed Area (LMDA) (Figure 8.1-1c). The LMDA encompasses the City of Chilliwack and municipalities extending west (*e.g.*, Abbotsford, Surrey, Coquitlam, Burnaby and Vancouver). The LMDA was delineated in an effort to address the agglomeration of municipalities in the Lower Mainland, an area recognized as having a development and human use priority and that has already been transformed from natural conditions by extensive urban, commercial, industrial, and agricultural activity, but which contains areas of highly valued green space.

A concern expressed from a public perspective during ESA Workshops and Community Workshops was the continued protection of valued green space within the LMDA, therefore, future developments identified as encroaching into defined natural spaces that may also be affected by the Project were identified. Only one such development was identified – a portion of the Golden Ears Connector development through a City of Surrey greenbelt, as shown in Figure 8.1-1c and described in Appendix 8.1.

8.1.4.1 Alberta (Edmonton to Alberta/British Columbia Border)

Agriculture and Livestock Grazing

Strathcona, Parkland and Yellowhead counties are working to support and maintain the agricultural sector in light of global demands on certain commodities and cost to invest in agriculture. For example, an objective of Parkland County and Strathcona County MDPs is to encourage the growth and expansion of value-added agricultural or industrial agricultural uses such as food processing facilities (Parkland County 2007, Strathcona County 2007). Similarly, an objective of the Yellowhead County MDP is to maintain and support agriculture as an important industry and way of life in Yellowhead County and promote the growth and diversification of extensive and intensive agricultural operations (Yellowhead County 2006).

Agriculture activities within the RSAs of various elements are expected to continue into the future and will act cumulatively with the Project. However, no specific future developments such as feedlot proposals have been identified.

Forestry Activities

Future forestry activities within the RSAs are generally limited to timber harvesting within RSAs along the western portion of the Edmonton to Hinton Segment in the Weyerhaeuser and West Fraser FMAs.

Effective until 2024, the approved AAC for the Weyerhaeuser FMA is 514,856 m^3 of coniferous wood and 328,663 m^3 of deciduous wood. According to estimates provided in Weyerhaeuser's Detailed Forest Management Plan Mountain Pine Beetle Addendum, actual harvest volumes for coniferous and deciduous wood are predicted to gradually increase in the FMA over this time period (Weyerhaeuser 2008b). Although the AAC for coniferous wood in the West Fraser FMA is 1,766,576 m^3, estimated volumes provided in West Fraser's 2011 Annual Operating Plan increase gradually per year from 1,507,780 m^3 in 2011 to 1,676,000 m^3 in 2015. With the exception of a 2011 estimate of 130,000 m^3, estimated deciduous volumes remain at 125,000 m^3 over the same period (West Fraser 2011). Increases in AACs result from implementation of harvest strategy measures supported by provincial initiatives to combat the increasing threat to Alberta forests from mountain pine beetle infestations.

Due to limited quantitative data and general nature of the information available regarding timber harvesting plans in the vicinity of the proposed pipeline corridor, forest harvest was not included in the quantitative analysis of reasonably foreseeable future developments.

Public, Tourism, Arts and Recreation Development and Activities

The Alberta Inventory of Major Projects (AEAE 2013) provides an information source from which future public, tourism, arts and recreation-based developments were identified. Details are variable for any given development and, as such, it is difficult to determine how likely "proposed" developments are to proceed without confirmation through other publicly available information. Most public, tourism, arts and recreational-based future developments are located in the City of Edmonton and the immediate surrounding area.

Public, tourism, arts and recreational-based future developments currently under construction or proposed are provided in Table 8A.1-5 of Appendix 8.1 and include: new libraries; expansion of the Edmonton Valley Zoo; heath care facilities, including Edson Health Care Centre and Strathcona Hospital Phase 1; recreation and arts facilities, including the Entertainment District Development Project and Downtown Performing Arts Centre; park and historical site upgrades and restorations; and an Edmonton Police Service Northwest Campus.

Various elementary, secondary and post-secondary institution capital projects, including expansions, upgrades and new developments, are proposed in the City of Edmonton and surrounding communities (Government of Alberta 2013a, Alberta Infrastructure n.d.). Notable developments for post-secondary institutions are provided in Table 8A.1-5 of Appendix 8.1 and include: University of Alberta Dentistry/Pharmacy Building Repurposing; University of Alberta Student Physical Activity and Wellness Centre; NorQuest College North Learning Centre (Downtown Campus) Development; and NAIT Centre for Applied Technologies.

Many of these developments will be in-service prior to 2016 and, therefore, will not occur concurrently with construction of the Project. A notable exception is the Downtown Performing Arts Centre in the City of Edmonton, which involves construction of an open-air arts galleria, a 1,600-seat theatre and 3 smaller spaces, an underground parking garage and an office tower. The current construction schedule of this development is from 2014 to 2017 (AEAE 2013). In addition, two large-scale developments — the Edmonton Area and Entertainment District Development Project, which includes a new arena to house the Edmonton Oilers, and the Royal Alberta Museum — are scheduled to be in-service by 2016 (Alberta Infrastructure 2013, City of Edmonton 2013a).

Rural and Urban Residential and Commercial Development

Population of the City of Edmonton and many surrounding communities will continue growing into the immediate future, with particularly strong growth projected for the City of Edmonton. In general, slower growth is projected for many rural communities further west along the Edmonton to Hinton Segment (the Socio-Economic Technical Report [Volume 5D] provides additional information).

Residential and commercial developments over $50 million in the RSAs that are either proposed or under construction in Alberta under the Alberta Inventory of Major Projects (AEAE 2013) include:

- Station Pointe Greens Residential Co-operative – Edmonton ($65 million) (proposed);
- The Corners I Condo Tower – Edmonton ($80 million) (proposed);
- Kelly Ramsey Building Redevelopment – Edmonton ($250 million) (proposed);
- Ultima Tower Luxury Condo Development – Edmonton ($65 million) (construction started [2012 to 2015]); and
- Century Crossing Commercial Development – Spruce Grove ($75 million) (construction started [2010 to 2013]).

Other proposed developments under $50 million in the RSAs include condominiums, apartments, housing complexes, retirement residences, retail outlets and other commercial and residential developments in the City of Edmonton and surrounding areas (AEAE 2013). The identified residential and commercial developments are anticipated to be in-service prior to 2016 and, therefore, will not occur concurrently with construction of the Project. Other proposed residential and commercial developments where schedule details are unavailable are assumed to be constructed concurrently with the Project.

Transportation and Infrastructure Development

Current and future transportation activities within the RSAs of various elements include regular and commercial vehicle traffic and rail traffic, as well as maintenance, reconstruction and upgrade activity on roads, bridges and highways, particularly within and near the City of Edmonton, where many transportation and infrastructure developments are currently under construction and in various planning and design phases (Alberta Enterprise and Advanced Education 2013, Alberta Transportation 2013a,b). Proposed future transportation developments currently under construction or proposed in the Edmonton area are provided in Appendix 8.1 and include: a new park and ride; light rail transit (LRT) upgrades; the Queen Elizabeth II Highway and 41st Avenue S.W. Interchange; a Northeast Transit Garage; and the Northeast Anthony Henday Project.

According to the growth forecast in the Capital Region Growth Plan, low-density residential use will continue to expand to Greenfield areas as the most common form of residential land use development in the Capital Region (*i.e.*, an “out” not “up” approach), which encompasses, among other areas, the City of Edmonton and Strathcona and Parkland counties (Capital Region Board 2009). In an effort to discourage urban sprawl and support infill development, the Capital Region, particularly the City of Edmonton, places a high priority on development of alternate transportation modes, which includes considerable expansion of LRT services (Capital Region Board 2009, City of Edmonton 2011).

Five LRT extension projects are in various stages of development along the existing LRT system in Edmonton. Currently under construction, the North LRT to NAIT (Metro Line) is a 3.3 km extension from Churchill LRT Station in downtown Edmonton northwest to NAIT (Table 8A.1-5 of Appendix 8.1). The expected in-service date for the Metro Line is spring 2014 (City of Edmonton 2013b). The proposed Southeast to West LRT (Valley Line) is a priority project for the City of Edmonton, which has approved partial funding for the project (LRT Projects Information Centre pers. comm.). The proposed 27 km Valley Line will run from Mill Woods to Lewis Farms, crossing through downtown Edmonton (City of Edmonton 2013b) (Table 8A.1-5 of Appendix 8.1). Construction of the Valley Line is expected to begin in 2015, with an anticipated completion date of 2019 (LRT Projects Information Centre pers. comm.).

Concept plans have been developed for the Northeast LRT, Northwest LRT and South LRT extension projects; however, construction of these lines has not been prioritized by the City of Edmonton and funding is not currently in place for these developments. Construction timelines will depend on a number of factors including funding availability, projected ridership potentials, and current and future community growth. The City of Edmonton is committed to expanding the LRT network to five lines running to all sectors of the city by 2040 (LRT Projects Information Centre pers. comm.). These developments are, however, considered hypothetical and excluded from this cumulative effects assessment.

West of Edmonton, Highway 16 preservation and overlay activities are planned between 2013 and 2016 at selected sites between the towns of Hinton and Edson, resulting in approximately 80 km of upgrades (Alberta Transportation 2013a). Several other smaller preservation and overlay projects are planned along Highway 16 at locations between Edmonton and Hinton within the same period (Alberta Transportation 2013a), as well as Highway 22 bridge construction and highway realignment near Drayton Valley (refer to Table 8A.1-5 of Appendix 8.1 for additional details). In addition, the Parkland Airport is a proposed $35 million (Phase 1 only) development near Spruce Grove, with construction of Phase 1 conditionally planned for 2013 to 2014 and Phase 2 in 2015 or later (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a).

Utility Activities

The AltaLink Western Alberta Transmission Line Project will operate as a 500 kV high-voltage direct current overhead line extending from the Genesee area west of Edmonton to the Langdon area east of Calgary (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The transmission line is currently under construction, with an expected in-service date of spring 2015 (AltaLink 2013).

The EPCOR and AltaLink Heartland Transmission Project will operate as an overhead double circuit 500 kV transmission line, which will connect the Heartland Substation (northwest of Fort Saskatchewan) to the Ellerslie Substation in Sherwood Park (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The transmission line is currently under construction, with an expected in-service date of spring 2015 (AltaLink and EPCOR 2013).

The ATCO Electric Eastern Alberta Transmission Line Project will operate as a 500 kV high-voltage direct current overhead line extending 500 km from the Gibbons-Redwater area northeast of Edmonton to the Brooks area southeast of Calgary (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The transmission line is currently under construction, with an expected in-service date of late 2014 (ATCO Electric 2013).

The proposed ATCO Gas Urban Pipelines Replacement Project entails the construction of a new high-pressure natural gas pipeline network in the Transportation/Utility Corridor of Edmonton over a period of five years (ATCO Gas 2013). The application is currently under review by the AUC (2013b) and, pending project approval, construction of the Urban Pipelines Replacement Project is expected to be concurrent with Project construction (refer to Table 8A.1-5 of Appendix 8.1 for additional details).

Other ongoing utility activities within the RSAs include maintenance on transmission line rights-of-way and electrical facilities.

Oil and Gas Exploration and Development Activities

Companies that have recently applied to federal and provincial authorities to construct and operate oil and gas developments within the RSAs for various elements are listed in Tables 8A.1-1 to 8A.1-4 of Appendix 8.1 and are shown on Figure 8.1-1a.

Major Developments

Enbridge Pipelines Inc. (Enbridge) is proposing to construct and operate the Edmonton to Hardisty Pipeline Project; a proposed 181 km new 914.4 mm (NPS 36) crude oil pipeline from the existing Enbridge Edmonton Terminal to the existing Enbridge Hardisty Terminal (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The proposed pipeline right-of-way will be alongside and contiguous to an existing Enbridge pipeline right-of-way and other linear disturbances for approximately 96.6% of its length. The application to the NEB is currently under review (submitted December 14, 2012) (NEB 2013c). Pending regulatory approval, the proposed pipeline is expected to be in-service by early 2015 (NEB 2013c).

The proposed 38.2 km Enbridge Line 2 Replacement Project parallels the alignment of the Edmonton to Hardisty Pipeline Project (above) from the Enbridge Edmonton Terminal at NE 32-52-23 W4M to a valve located near Joseph Lake at SW 1-50-22 W4M (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). NEB approval was granted for the pipeline project on May 17, 2013 (Order XO-E101-013-2013) and construction commenced in August 2013 with an in-service date of late 2013 (NEB 2013d).

Enbridge is applying to the NEB to construct the Edmonton Terminal (South) Expansion Project (Table 8A.1-5 of Appendix 8.1). The project involves the construction and operation of several new tanks and associated facilities at the existing Enbridge Edmonton Terminal at NW 32-52-23 W4M, with transfer pipe via NE 32-52-23 W4M that integrates the new tanks to the existing terminal at SE 5-53-23 W4M. NEB approval was granted for the facility project on July 25, 2013 (Order XO-E101-017-2013) and pre-clearing activities commenced in fall 2013 with operations to begin in the first half of 2015 (NEB 2013e).

As Northern Gateway Pipelines Ltd. Partnership, Enbridge is also applying to the NEB to construct the Northern Gateway Project from Bruderheim, Alberta to Kitimat, BC (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). Key components of the project include: separate oil and condensate pipelines, each of about 1,172 km in length; 10 pump stations; all-weather road access and electrical power infrastructure for the pump stations and the Kitimat Terminal; fourteen 78,860 m^3 (496,000 bbl) capacity tanks; a utility berth; and two marine loading and unloading berths. Pending regulatory approval, construction is anticipated to occur from 2014 to 2017 (NEB 2013f). Therefore, construction of the Northern Gateway Project is assumed to be concurrent with Project construction.

ACCESS Pipeline Inc. (ACCESS) is proposing to construct and operate the ACCESS Northeast Pipeline Expansion from the Conklin area to the Redwater area (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The proposed 1,067 mm low vapour pressure bitumen blend pipeline is approximately 295 km long and will extend from a pump station near Conklin at 1-16-77-5 W4M to the existing ACCESS Sturgeon Terminal at 4-18-56-21 W4M. The application to the AER is currently under review (submitted June 15, 2012) (ERCB 2013b). Pending regulatory approval, the proposed pipeline is expected to be in-service by early 2015 (ACCESS 2013).

Grand Rapids Pipeline GP Ltd. (Grand Rapids), a subsidiary of TransCanada PipeLines Ltd. (TransCanada), is proposing to construct and operate the Grand Rapids Pipeline Project, a proposed pipeline that includes both a crude oil and a diluent line to transport volumes approximately 500 km between the producing area northwest of Fort McMurray and the Edmonton/Heartland region (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The application to the AER is currently under review (submitted May 23, 2013) (ERCB 2013c). Pending regulatory approval, construction is expected to commence in summer 2014, with an expected in-service date of early 2017 (TransCanada 2013a). Therefore, construction of the Grand Rapids Pipeline Project is assumed to be concurrent with Project construction.

Heartland Pipeline GP Ltd. and TC Terminals GP Ltd., subsidiaries of TransCanada, are proposing to construct and operate the Heartland Pipeline and TC Terminals Projects (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The development is split into two separate projects. The first project is a proposed 914 mm (36 inch) crude oil pipeline extending approximately 200 km from 13 km northeast of Fort

Saskatchewan to 7 km south of Hardisty, also entailing the construction of two pump stations. The second is a proposed tank storage facility near Fort Saskatchewan at SW/SE 28-55-21 W4M. The project is currently in the pre-application stage (AER filing planned for Q3 2013), with construction expected to commence from summer 2014 to early 2015 (TransCanada 2013b).

Enhance Energy Inc. has received regulatory approval to build the Alberta Carbon Trunk Line (AEAE 2013). The proposed route for the carbon capture and storage project begins near Fort Saskatchewan, Alberta and ends southeast of Lacombe, Alberta (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). Construction of the facilities associated with the Alberta Carbon Trunk Line began in 2012 and the pipeline is set to begin construction in 2013 with completion of the project expected by the end of 2013.

Enbridge Pipelines (Woodlands) Inc. is proposing to construct and operate the Woodland Pipeline Extension Project, which entails construction and operation of two pump stations and a pipeline that would transport diluted bitumen from Enbridge Pipelines (Athabasca) Inc.'s existing Cheecham terminal, located at 7-8-84-6 W4M in Fort McMurray, Alberta, to Enbridge's existing Edmonton terminal, located at 5-4-53-23 W4M in Sherwood Park, Alberta (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The proposed pipeline route generally parallels several existing pipelines and is approximately 385 km in length (Enbridge 2012). The Woodland Pipeline Extension Project was approved by the ERCB on August 30, 2012 (ERCB 2012). The construction schedule was revised and the anticipated start date is not known, however, operation is scheduled for 2015 (Enbridge 2012).

Shell Canada Ltd. (Shell) is proposing to construct and operate the Quest Carbon Capture and Storage Project, which entails construction of facilities for the capture of 1.2 megatonnes of CO_2 per year at the existing Shell Scotford Upgrader at 12-32-55-21 W4M; construction of an 80 km pipeline to transport dense-phase CO_2 from the Scotford Upgrader to the sequestration site located north of the County of Thorhild at 15-29-60-21 W4M; and construction of three to eight CO_2 injection wells connected to the main pipeline by laterals, each of which would be less than 15 km long (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The Quest Carbon Capture and Storage Project was approved by the ERCB on July 10, 2012 and is anticipated to enter operation during 2015 (Shell 2013).

Inter Pipeline Ltd. (Inter Pipeline) is proposing to construct and operate the Polaris Expansion Project – Edmonton Extension from Lamont to Sherwood Park (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The project consists of the installation of approximately 50 km of 24 inch diluent pipeline and facilities from Edmonton area diluent receipt points to the Polaris Lamont Pump Station. The new pipeline will provide 111,290 m^3/d (700,000 bbl/d) of diluent supply capacity to the Lamont Station. The project is currently in the proposal stage, with construction expected to commence from 2013 to 2016 (Inter Pipeline 2012).

Plains is proposing to construct and operate the Western Reach Pipeline System from Gordondale to Fort Saskatchewan (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1a). The project entails construction of a dual 570 km pipeline system originating in the Gordondale area to meet the transportation and processing demands of producers drilling in the Deep Basin. The project is currently in pre-application stages and, pending regulatory approval, is expected to be in-service by late 2015 (Plains 2013).

Trans Mountain is currently in the process of constructing the Edmonton Terminal Expansion Project, which involves constructing 10 new tanks and associated facilities at the Edmonton Terminal. This project was approved by the NEB in March 2008 and is now being constructed under Amending Order AO-005-XO-T246-04-2008. In February 2013, Trans Mountain applied to the NEB to vary Amending Order AO-005-XO-T246-04-2008 to permit construction of four additional tanks at the Edmonton Terminal for a total of 14 tanks. The NEB issued an Amending Order AO-006-XO-T246-04-2008 on June 20, 2013 and the four additional tanks are expected to come into service by late 2014.

Sasol Canada Holdings Ltd. (Sasol) is proposing to construct and operate the Natural Gas to Liquid Fuel Plant in Edmonton, which is a gas to liquid conversion facility. The approximately $8 billion development would create more than 500 new, permanent skilled jobs once in operation and employ over 5,000 other individuals during peak construction periods. The project is currently in the pre-application stages. Pending approval, the anticipated in-service date is late 2015 (Sasol 2012).

Minor Developments

The aforementioned oil and gas developments are considered to be major capital projects. In addition to these, however, there are numerous smaller oil and gas developments, including pipelines, facilities and wells, within the RSAs for various elements (ERCB 2013a, IHS Inc. 2013a,b,c) (Tables 8A.1-2 to 8A.1-4 of Appendix 8.1 and Figure 8.1-1a). Although the development schedules for these developments are unknown, given the limited scope and short anticipated construction times, for the purposes of the cumulative effects assessment, it was assumed that these developments would be constructed prior to construction of the Project.

Additional activities in the various RSAs not listed in Appendix 8.1 may include ongoing oil and gas exploration as well as regular pipeline and facility upgrades and maintenance activities.

Mineral Resources

Within the various RSAs, two proposed coal mine developments have been identified with project applications currently under regulatory review by the AER.

The Coal Valley Resources Inc. Robb Trend Project is a proposed extension to the existing mining and coal processing activities at Coal Valley Mine, approximately 40 km southeast of Hinton. The development is located adjacent to existing mining operations, and will yield approximately 88.75 million clean metric tonnes of coal available for sale. This additional tonnage would provide Coal Valley Resources Inc. with the necessary resources to operate until 2038. The proposed development application was submitted to ERCB in April 2012 and is currently under review. Pending regulatory approval, construction and operation will occur in stages, with construction of Stages 1A and 1B occurring from late 2013 to 2017 and initial operations anticipated to commence in late 2014 (AESRD 2013). Consequently, construction of the Robb Trend Project is assumed to be concurrent with Project construction.

The proposed Coalspur Mines Ltd. (Coalspur) Vista Coal Mine Project (Vista Project) will develop 5 million clean tonnes per year of moderately low-rank bituminous coal, suited for thermal electric generation. The proposed mine is approximately 10 km east of the Hinton town boundary and extends southeast for approximately 12 km to the McLeod River valley. The proposed development will involve construction of a surface coal mine including pits, external waste rock dumps and a full range of surface coal mining and support equipment and infrastructure. A load-out facility will load coal into rail cars on a siding that will be constructed, owned and operated by CN Rail. Projected labour requirements include approximately 700 person-years of construction and approximately 510 full-time positions during operation. The proposed development application was submitted to ERCB in May 2012 and is currently under review (AESRD 2013). Pending regulatory approval, construction will occur in stages, and is expected to start in 2014. Initial operations are anticipated to commence in 2015. Although operations will commence prior to Project construction, construction activities are expected to be ongoing and, therefore, construction of the Vista Project is assumed to be concurrent with Project construction.

Both the Robb Trend and Vista coal mine projects are listed in Table 8A.1-1 of Appendix 8.1 and shown on Figure 8.1-1a.

8.1.4.2 British Columbia (Alberta/British Columbia Border to Westridge Marine Terminal)

Agriculture and Livestock Grazing

Within interior BC, there is increasing awareness of the importance and vulnerability of agricultural lands, as reflected in the recent amendment to the Thompson-Nicola Regional Growth Strategy, which is to provide support for the preservation of agricultural lands and local food production (TNRD 2013).

ALR-designated lands in southwest BC, particularly those west of the City of Abbotsford, are under encroachment from urban expansion and other non-agricultural uses (Condon and Mullinix 2009). The need to protect the over 50,000 ha of agricultural lands in Metro Vancouver is considered an important challenge moving into the future (Metro Vancouver 2011). In an effort to address this important issue, the Township of Langley and cities of Surrey, Abbotsford and Chilliwack have endeavoured to develop agricultural plans to guide agricultural practices into the future. Some of the key objectives, strategies and/or goals of Surrey's Agriculture Protection and Enhancement Strategy, the Township of Langley's

Draft Agricultural Viability Strategy, Abbotsford's Agriculture Strategy and Chilliwack's Agricultural Area Plan are to enhance opportunities for agricultural enterprise; encourage agricultural use, conservation and environmentally responsible practices; and invest in agricultural services and infrastructure (City of Abbotsford 2011, City of Chilliwack 2012, City of Surrey 2013b, Township of Langley 2013).

As an increasingly valued resource, agriculture and related activities within the RSAs of various elements are expected to continue strongly into the future and will act cumulatively with the Project. However, no specific future developments such as meat packing plants or greenhouses have been identified.

Forestry Activities

Future forestry activities within the RSAs are generally limited to timber harvesting within the RSAs along the Hargreaves to Darfield and Black Pines to Hope Segments.

Over the last decade, AAC for beetle-affected TSAs was increased as part of a provincial action plan to manage the mountain pine beetle infestation (BC Ministry of Forests 2004). For example, in 2011 approximately 63%, 52% and 75% of timber harvested in the Robson Valley, Kamloops and Merritt TSAs was pine, when pine stands only account for 13%, 30% and 58% of the timber harvesting land base, respectively (BC MFLNRO 2012a,b,c). However, harvest patterns are expected to change over the coming years, as the mountain pine beetle infestation is considered to have mostly run its course; as a result, the Province is working to update its forest inventory and reforestation plans (BC MFLNRO 2012d).

The latest provincial-level mountain pine beetle model for the Robson Valley TSA suggests that mortality is projected to end in 2017 with a cumulative total (TSA and community forests) dead pine volume of 3.2 million m^3. Future harvest rates and locations are difficult to predict. The Robson Valley TSA is currently undergoing a formal timber supply review process that is expected to be complete with a new AAC determination in late 2013 (BC MFLNRO 2012a).

The timber supply review analysis indicates the timber supply in the Kamloops TSA is expected to decline from an AAC of 4 million m^3 to 1.82 million m^3 for an estimated 80 years, preceded by a step down in 2012 to 2.5 million m^3 over the first 5 years (BC MFLNRO 2012b). Since actual harvest levels have not approached the AAC, the impact of maintaining a high AAC on timber supply is uncertain. Furthermore, current forecasts of the mountain pine beetle infestation are less severe. Original predictions were for a 78% cumulative kill of pine by 2017, whereas current projections are 51% by 2022 (BC MFLNRO 2012b). A decrease from the current harvest level of 2.5 million m^3 to 1.82 million m^3 will result in a reduction of approximately 948 person-years of total employment within the TSA (BC MFLNRO 2012b). Considerable reductions in the AAC uplift that was adjusted to address the mountain pine beetle infestation could reduce current regional milling output (BC MFLNRO 2012b).

A recent timber supply forecast demonstrated that timber supply in the Merritt TSA is projected to decline by 39%, from 2.4 million m^3 a year to 1.47 million m^3, which will be implemented over several decades of gradual reductions. Similar to the Kamloops TSA, if the volume cannot be replaced from other sources, reductions in the AAC uplift that was adjusted to address the mountain pine beetle infestation could reduce current regional milling output (BC MFLNRO 2012c).

Now that the mountain pine beetle infestation has mostly run its course, many beetle-affected TSAs are entering a recovery period and it is difficult to predict what future harvest activities will be. Based on reduced AAC rates, it could be inferred that forest harvesting activities in many RSAs will decrease to some degree compared to recent levels. However, other types of forestry activities may be on the rise as BC MFLNRO begins to concentrate greater efforts on reforestation, fuel management and intensive and innovative silviculture (BC MFLNRO 2012d).

Public, Tourism, Arts and Recreation Development and Activities

The BC Major Projects Inventory (BC MJTST 2012) provides an information source from which future public, tourism, arts and recreation-based developments are identified in the various RSAs. Details are variable for any given development, as such, it is difficult to determine how likely "proposed" developments are to proceed without confirmation from other publicly available information. Most public, tourism, arts and recreational-based future developments are located in the LMDA, which is shown on Figure 8.1-1c.

Public, tourism, arts and recreational-based future developments currently under construction or proposed are provided in Table 8A.1-6 of Appendix 8.1 and, in the Lower Mainland, include heath care facilities, such as the BC Children's and Women's Hospital Expansion and Surrey Memorial Hospital Emergency Department and Critical Care Tower; recreation and entertainment facilities, including the Pacific National Exhibition Expansion, Vancouver Aquarium Revitalization and Expansion Project and the Casino, Hotel and Convention Centre; arts facilities, including relocation of the Vancouver Art Gallery; and the Surrey City Hall and Civic Facility.

Various elementary, secondary and post-secondary institution capital projects, including expansions, upgrades and new developments, are proposed in the Lower Mainland (BC MJTST 2012). Notable developments for post-secondary institutions are provided in Table 8A.1-6 of Appendix 8.1 and include Great Northern Way Campus Expansion; Simon Fraser University Student Union Building and Stadium; and UBC Student Union Building.

Public, tourism, art and recreational-based future developments identified outside of the Lower Mainland include a new clinical services building, parking and site infrastructure upgrading at the Royal Inland Hospital in Kamloops, and a Faculty of Law Building at Thompson Rivers University in Kamloops.

Many of these developments will be in-service prior to 2016 and, therefore, will not occur concurrently with construction of the Project. Notable exceptions include:

- the Simon Fraser University Student Union Building and Stadium: construction of a 9,290 m^2 student union building and 2,500 seat outdoor stadium from 2013 to 2017 (Table 8A.1-6 of Appendix 8.1);
- BC Children's and Women's Hospital Expansion: redevelopment of the BC Children's and Women's Hospital to create a state of the art facility for pediatric care and research, which is currently under construction with an expected in-service date of 2018 (Table 8A.1-6 of Appendix 8.1); and
- the Great Northern Way Campus Expansion: construction of a state-of-the-art Emily Carr visual, media and design art facility that would accommodate up to 1,800 students, which is currently under construction with an expected in-service date of July 2016 (Table 8A.1-6 of Appendix 8.1).

Several developments were identified in the various RSAs in early development stages, or appeared to be inactive or on hold, including Westscapes Development Inc. Coquihalla Pass Resort Development Project, Fraser Health Royal Columbian Hospital Expansion, and Valemount Glacier Destinations Ltd. Valemount Glacier Destination Resort. These developments are considered to be hypothetical and are, therefore, excluded from the cumulative effects assessment.

Rural and Urban Residential and Commercial Development

The populations of many communities in the various RSAs will continue growing into the immediate future, with particularly strong growth projected for communities in the FVRD and Metro Vancouver (the Socio-Economic Technical Report [Volume 5D] provides additional information).

Residential and commercial developments over $200 million that are either proposed or under construction in the Lower Mainland under the BC Major Projects Inventory include:

- 208 Street Residential Neighbourhood – Langley ($250 million) (proposed);
- Mission Waterfront Project – Mission ($1.5 billion) (proposed);
- Delsom Estates Residential Development – Delta ($250 million) (proposed);
- Silverdale Hill Housing Development – Mission ($400 million) (proposed);
- Waterfront Development Complex – New Westminster ($300 million) (proposed);
- Concord Gardens Residential Development – Richmond ($350 million) (proposed);

- River Green Residential Development – Richmond ($500 million) (construction started – summer 2010 to 2022);
- Holland Pointe Residential Development – Surrey ($200 million) (proposed);
- King George Commercial/Residential Development – Surrey ($1.6 billion) (proposed);
- Urban Village Condominium Development – Surrey ($1 billion) (construction started – complete by 2013);
- Quattro Residential Development – Surrey ($625 million) (construction started – completion date unknown);
- Central City Neighbourhood – Surrey ($1 billion) (construction started – completion date unknown);
- Guildford Town Centre Expansion – Surrey ($280 million) (construction started – May 2010 to fall 2015);
- Tsawwassen Springs Development – Tsawwassen ($400 million) (construction started – spring 2010 to 2016);
- the Exchange Office Tower – Vancouver ($200 million) (proposed);
- Burrard Gateway Mixed Use Development: Hornby and Drake Street – Vancouver ($500 million) (proposed);
- Oakridge Centre Redevelopment – Vancouver ($700 million) (proposed);
- Cambieplace Condominiums – Vancouver ($200 million) (proposed);
- Supportive Housing – Vancouver ($225 million) (proposed);
- South Burrard Development – Vancouver ($1 billion) (proposed);
- Little Mountain Housing Redevelopment – Vancouver ($300 million) (proposed);
- Telus Garden Communications Centre – Vancouver ($750 million) (under construction – complete by May 2015);
- Hotel and Residential Development: West Georgia – Vancouver ($500 million) (proposed);
- Residential Development and Arena Complex – Vancouver ($350 million) (proposed);
- BC Social Housing Initiative – Vancouver ($205 million) (under construction – complete by 2013);
- UBC Wesbrook Place Residential Development – Vancouver ($200 million) (under construction – complete by 2015);
- UBC University Town – Vancouver ($350 million) (under construction – complete by summer 2015);
- River District Development – Vancouver ($4 billion) (under construction – complete by 2032);
- Norquay Village Neighbourhood Centre – Vancouver ($ unknown) (under construction – complete by 2030); and
- Vicarro Ranch Residential Development – Abbotsford ($560 million) (proposed).

Other proposed developments under $200 million in the RSAs include condominiums, apartments, townhouses, housing, retail outlets, malls and other commercial and residential developments in Chilliwack, Abbotsford, Surrey, Coquitlam, Burnaby, Vancouver and other municipalities of the Lower

Mainland. The identified residential and commercial developments anticipated to be in-service prior to 2016 will not occur concurrently with construction of the Project. Other proposed residential and commercial developments where schedule details are unavailable are assumed to be constructed concurrently with the Project.

Transportation and Infrastructure Development

Current and future transportation activities within the RSAs of various elements include regular and commercial vehicle traffic and rail traffic, as well as maintenance, reconstruction and upgrade activity on roads, bridges and highways, particularly within the Lower Mainland where many transportation and infrastructure developments are currently under construction and in various planning and design phases (BC MJTST 2012).

Future transportation developments currently under construction or proposed in the Lower Mainland are provided in Appendix 8.1 and include Abbotsford International Airport (YXX) and Vancouver International Airport (YVR) upgrades and expansions; the Skytrain – Evergreen Line Rapid Transit Project and Expo Line Rapid Transit Project; Gateway Project – North and South Fraser Perimeter Road projects; bridge improvements; overpasses and underpasses; road realignments and upgrades; grade separations and improvements; Shortsea shipping projects; and demolition of the old Port Mann Bridge.

Expansion activities at YVR are currently underway and involve several phases, many of which are completed. Future planned activities include an additional terminal (by 2015) and runway (by 2023) and 14 additional gates. Upgrades are also proposed at YVR, including 700 m of corridors, moving walkways and a high-speed baggage system for the international terminal ($408 million), and upgrades to the domestic terminal ($488.7 million). Airfield improvements ($286.4 million) will include runway safety enhancements and upgrades to roads, bridges and dykes ($559.8 million). Upgrades to YVR have not commenced; however, they are anticipated to be complete by 2022. In Abbotsford, expansion of YXX will include a 1,300 m^2 passenger terminal and runway upgrades as well as a hotel and tourist-related services. The $30 million runway expansion portion of the project was completed in September 2011. Approximately 81 ha will be designated for future aerospace-related developments. Expansion activities are anticipated to be completed by 2020 (BC MJTST 2012).

According to the growth forecast in the Regional Growth Strategy, Metro Vancouver is expected to continue to grow by over 35,000 residents per year. Growth without sprawl implies greater density of development, which Metro Vancouver aims to achieve, in part, through support of a compact, transit-oriented urban form supporting a range of sustainable and strategically implemented transportation choices, including expansion of the SkyTrain network (Metro Vancouver 2011).

Two large-scale SkyTrain projects are currently underway in the Lower Mainland: the Evergreen Line; and the Expo Line Upgrade Strategy. The Evergreen Line is a new rapid transit line that will connect Coquitlam to Vancouver via Port Moody and Burnaby. Construction commenced in 2012 and the new line is expected to be in-service by 2016 (BC MTI 2013a, Province of BC 2013). The Expo Line Upgrade Strategy entails doubling the capacity of the existing Expo Line and adding a proposed 6 km SkyTrain extension in the Surrey to Fleetwood area. Construction commenced in 2008 and the project is expected to be complete by 2020 (Province of BC 2013, TransLink 2013b). Construction of both lines is expected to be concurrent with Project construction. TransLink is also considering several other large-scale projects, including the UBC Line, Surrey Line, Burnaby Mountain Gondola and Pattullo Bridge Replacement. However, both SkyTrain lines and the bridge replacement are currently in early planning and routing stages and the gondola is considered low priority; therefore, these developments are hypothetical in nature and were not included in part of this cumulative effects assessment (TransLink 2013b,c).

The Gateway Program was established by the Province of BC in 2003 to improve the movement of people, goods and transit throughout Metro Vancouver by providing efficient transportation choices and better connections. Ongoing projects as part of the Gateway Program include the Port Mann Bridge/Highway 1 Improvements and the South Fraser Perimeter Road. Both developments are anticipated to be fully complete by late 2013. The Port Mann Bridge/Highway 1 Improvements project includes a new 10-lane bridge across the Fraser River between Coquitlam and Surrey, 37 km of highway widening from Vancouver to Langley, including 30 km of new high occupancy vehicle lanes, and the replacement of nine highway interchanges (BC MTI 2013b). As part of the improvements project, a portion of the Golden Ears Connector development has the potential to act in combination with the Project to impact a City of Surrey greenbelt in the LMDA (Figure 8.1-1c and Table 8A.1-1 of Appendix 8.1). The South Fraser Perimeter Road Project includes a 40 km long four-lane route along the south side of the Fraser River from Deltaport Way in southwest Delta to 176th Street (Highway 15) in Surrey, with connections to Highways 1, 15, 17, 91, 99 and TransLink (Fraser Transportation Group Partnership 2011). The North Fraser Perimeter Road Project is currently in the proposal stage, and entails improved trucking and vehicle routes along an extended United Boulevard through Coquitlam along Highway 7 to the north end of the Golden Ears Bridge and along the north end of the Queensborough Bridge along Front, Columbia and Brunette in New Westminster (BC MJTST 2012).

Several Trans-Canada Highway improvement projects are either planned or underway east of the City of Kamloops, including widening Highway 1 between Monte Creek and Pritchard (construction from October 2011 to fall 2014) to four lanes; improvements to re-align and widen 3.1 km of highway to four lanes through Hoffman's Bluff (construction from 2013 to fall 2015); and improvements to widen 3 km of the Trans-Canada Highway to four lanes from Pritchard to Hoffman's Bluff (construction from spring 2013 to fall 2015) (BC MJTST 2012) (Table 8A.1-6 of Appendix 8.1). These developments are part of the Highway 1 Kamloops to Golden Project, the long-term plan of which is to upgrade the primarily two-lane highway to a modern four-lane highway (BC MTI 2013c).

Additional minor capital works in the various RSAs outside the Lower Mainland not listed in Appendix 8.1 include 42 km of Highway 5 resurfacing north of Kamloops between the Avola Overhead and the Whitewater River; a 1.78 km passing lane along Highway 5 north of Blue River; overlay paving of existing lanes and shoulders on 23 km of Highway 5 from Albreda to CN Rail Overhead; resurfacing 19 km of Highway 5 between Valemount and the Junction of Highway 16 at Tête Jaune; asphalt resurfacing of 44 km of lanes along Highway 5 south of Kamloops; asphalt surfacing with overlay along Highway 5 south of Kamloops; and resurfacing of Highway 3 from the Hope overpass to Nicolum Creek Bridge along Highway 5 (6.6 km) and mill and fill of the slow lane along Highway 3 from the Othello Interchange onward, with localized pavement repair taking place as required (BC MTI 2013d). Given the limited scope and short anticipated construction times, for the purposes of the cumulative effects assessment, it was assumed that these developments would be constructed prior to construction of the Project.

Utility, Public Works and Alternative Energy Development

Utility, public works and alternative energy future developments currently under construction or proposed are provided in Tables 8A.1-1 and 8A.1-6 of Appendix 8.1 and include: water power projects; transmission lines; electrical substations; and other developments pertaining to energy generation and waste treatment and disposal.

To be considered in this cumulative effects assessment, at a minimum, water power projects must be granted an investigative license by BC MFLNRO to commence site studies as part of the investigative phase of a proposed water power project. Approximately 20 proposed hydroelectric developments under review as of May 31, 2013 for an investigative license in the various RSAs were considered hypothetical and, therefore, were not included in this cumulative effects assessment.

In total, approximately 49 proposed future water power projects (*e.g.*, run-of-river, pumped storage) were identified within the various RSAs. Future water power projects for which location and footprint details were available (either publicly available online or through direct contact with FrontCounter BC) are provided in Table 8A.1-1 of Appendix 8.1 and shown in Figures 8.1-1b and 8.1-1c. However, location and footprint details were considered insufficient for 7 of the 49 identified future water power projects and, therefore, could not be included in any quantitative analysis. These water power projects are provided in Table 8A.1-6 of Appendix 8.1 and include: the Princeton Energy Inc. Eureka Creek and Berkey Creek hydroelectric projects; the TransAlta Clemina Creek and Serpentine Creek hydroelectric projects; and the Innergex Renewable Energy Inc. Esme Creek Hydroelectric Project. The Clemina and Serpentine creek projects are anticipated to be in-service by summer 2014. As indicated in Table 8A.1-1 of Appendix 8.1, the construction schedule for other waterworks developments is unavailable, therefore, these projects are assumed to be concurrent with Project construction.

Of the 42 water power projects in Table 8A.1-1 of Appendix 8.1, 36 are run-of-river and 6 are pumped storage. Both development types generate power by diverting a specific volume of surface water via a penstock to a generating station, where turbines produce electricity. The electricity is then transported via a substation and transmission line to connect to the existing electrical grid. Penstocks for pumped storage projects are often trenchless (*i.e.*, drilled). Typically, run-of-river projects range in generating capacity from 1 to 20 megawatts (MW), however, three developments — the Robson Valley Hydroelectric Project, Kwoiek Creek Hydroelectric Project and Upper Pitt River Waterpower Project — will generate approximately 76.5 MW, 50 MW and 180 MW, respectively (Figures 8.1-1b and 8.1-1c).

The Holmes Hydro Inc. Robson Valley Hydroelectric Project consists of a series of 10 run-of-river plants with a total of 76.5 MW located on tributaries in the Holmes River watershed, approximately 10 km west of McBride. A License of Occupation was granted by BC MFLNRO and construction is anticipated to commence within the next year (Stanyer pers. comm.).

The Kwoiek Creek Resources and Innergex II Inc. Kwoiek Creek Water Power Project is located on the lower reaches of Kwoiek Creek, a tributary to the Fraser River approximately 22 km south of Lytton. The project will include approximately 80 km of 138 kV transmission line to the BC Hydro substation at Highland Valley. A BC EAO Amendment Certificate was issued in July 2011 and the development is anticipated to be in-service by late 2013 (Province of BC 2013).

Located approximately 45 km north of Coquitlam, the proposed Run-of-river Power Inc. Upper Pitt River Waterpower Project collectively consists of eight hydroelectric projects generating a combined 180 MW on Buklin, Steve, Pinecone, Homer, East Corbold, Corbold, Boise and Shale creeks. The draft Application Terms of Reference for the project (submitted to BC EAO on February 14, 2008) was never finalized and the project is currently considered inactive by the BC EAO (Murphy pers. comm.). However, investigative use permits were recently issued by BC MFLNRO (November 19, 2012 and March 5, 2013) and, although the project is considered low priority, Run-of-river Power Inc. is continuing site studies and other preliminary planning activities for the project (Hopp pers. comm.).

The largest pumped storage hydroelectric project identified for the cumulative effects assessment is the Isabel and Pitt Lake Pumped Storage Hydroelectric Project, a pumped storage hydro power system with a capacity of approximately 225 MW on Isabel and Pitt lakes, approximately 30 km north of Maple Ridge (Figure 8.1-1c). A License for Investigative Use was issued by BC MFLNRO on October 22, 2012 (BC MFLNRO 2013b). As indicated in Table 8A.1-1 of Appendix 8.1, the construction schedule for the Isabel and Pitt Lake Pumped Storage Hydroelectric Project and many other proposed waterworks developments is unavailable, therefore, these projects are assumed to be concurrent with Project construction.

Transmission line developments in the various RSAs that are considered in the quantitative analysis are the Interior to Lower Mainland Transmission Project and Merritt Area Transmission Project (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1c). Currently under construction, the BC Transmission Corporation Interior to Lower Mainland Transmission Project involves installation of a new 500 kV transmission line, mostly along the existing right-of-way, from the Nicola Substation near Merritt to the Meridian Substation in Coquitlam. The anticipated in-service date is January 2015 (Province of BC 2013). Also currently under construction, the BC Hydro Merritt Area Transmission Project involves the installation of a 35 km 138 kV transmission line between the Merritt and Highland substations, mostly along an existing unused BC Hydro right-of-way. The anticipated in-service date is summer 2014 (BC Hydro 2013b).

In addition, BC Hydro is proposing the Robson Valley Transmission Project, which would entail construction of a 138 kV transmission line from the existing Valemount Substation to a proposed new substation in the McBride area (BC Hydro 2012). However, since this development is currently in the early planning stages it is considered hypothetical and is not included in the cumulative effects assessment.

Utility, public works and alternative energy developments currently under construction or proposed within various RSAs in the Lower Mainland that are not considered in any quantitative analyses are provided in Table 8A.1-6 of Appendix 8.1, and include: the BC Hydro Big Bend Substation; UBC Biomass Heating Project; BC Hydro Burnaby to New Westminster Area Reinforcement; BC Hydro Capilano Substation Upgrade; Greater Vancouver Regional District Capilano (Cleveland) Dam Powerplant; BC Hydro Coquitlam Area Reinforcement; Greater Vancouver Regional District Iona Island Wastewater Treatment

Plant Upgrades; BC Hydro Kidd 2 Substation Upgrade Project; City of North Vancouver Lions Gate Sewage Treatment Plant; BC Hydro Lynn Valley Substation Upgrade, Phase 1; Metro Vancouver Waste-to-Energy Incineration Facility; City of Surrey Organic Biofuel Facility; BC Hydro Ruskin Dam Safety and Powerhouse Upgrade; Metro Vancouver Seymour-Capilano Filtration Project; BC Hydro Silverdale Substation Project; BC Hydro Surrey Area Substation Project; and City of Surrey Waste-to-Energy Incineration Facility. Construction schedules for these developments are provided in Table 8A.1-6 of Appendix 8.1; however, developments where a schedule is unavailable are assumed to be concurrent with Project construction.

In addition, utility, public works and alternative energy developments currently under construction or proposed within various RSAs outside the Lower Mainland that are not considered in any quantitative analyses are provided in Table 8A.1-6 of Appendix 8.1 and include: the Telus Data Centre in Kamloops; the BC Hydro Seymour Arm Series (Capacitor Station 5L71/5L72 Project) in Chase; the BC Hydro Nicola 500 kV Station Reconfiguration in Merritt; the Western Bioenergy Inc. Merritt Green Energy Project; the EcoTECH Energy Group McBride Biomass Project; the City of Kamloops Sewage Treatment Centre Upgrade; and Belkorp Environmental Services' Cache Creek Landfill Extension. Construction schedules for these developments are provided in Table 8A.1-6 of Appendix 8.1; however, developments where a schedule is unavailable are assumed to be concurrent with Project construction.

Environmental conditions in the Merritt area are ideal for wind energy production. However, no reasonably foreseeable wind energy developments have been identified in the RSAs. Proposed projects are either in early planning phases, on hold or inactive, as is the case for the proposed Premier Renewable Energy Nicomen Wind Energy Project (Province of BC 2013).

Additional activities in the various RSAs not listed in Appendix 8.1 may include new transmission lines, utility lines, substations and other facilities; and upgrades and maintenance activities to existing infrastructure.

Marine and Industrial Development

As noted above, although regulation and authorization of marine transportation is not specifically within the jurisdiction of the NEB, the environmental and socio-economic effects of the increased marine traffic is considered by Trans Mountain in accordance with the NEB's direction from their List of Issues for the Project, released on July 29, 2013. As a result, Trans Mountain is participating in Transport Canada's voluntary Technical Review Process of Marine Terminal Systems and Transshipment Sites (TERMPOL) process to address the potential increase in marine traffic to offload product from the Project. As part of the TERMPOL process, information on the movements of marine vessels, including fishing vessels and forecasts of likely future marine vessel traffic (*i.e.*, reasonably foreseeable) in the Marine Transport RSA, which includes Burrard Inlet, were identified (see Volume 8C-2). Marine vessel activities applicable to this cumulative effects assessment are further discussed below.

As a result of the Project, marine vessel traffic volume calling at the Westridge Marine Terminal will increase from approximately 5 to 34 loading tankers per month. The types of tankers calling at the Westridge Marine Terminal (*i.e.*, Panamax and Aframax sized tankers) will not change as a result of the Project. In addition, the vessels calling at the Westridge Marine Terminal (after the Project is in operation) will continue to use the existing marine shipping lanes.

Projected growth rates from 2012 to 2030 of non-Project-related vessel movements by vessel type (*e.g.*, tanker, cargo, tug, passenger) were calculated as part of the cumulative effects assessment for Marine Transportation (Volume 8A). Projected increases were calculated for the entire Marine Transportation RSA, from which predicted growth rates from 2012 to 2030 were roughly extrapolated for Burrard Inlet. Based on this approach, a reasonably foreseeable approximation of 288 vessels/year is anticipated by 2016 above existing 2012 levels of 6,858 and by 2030 there is estimated to be approximately 1,400 vessels/year over 2012 levels (not including Project-related marine vessel traffic) (refer to Section 4.4 of Volume 8A for additional details).

Proposed future industrial developments were identified in the various RSAs within the Lower Mainland, including shoreline developments regulated by PMV, and are listed in Table 8A.1-6 of Appendix 8.1.

The Neptune Bulk Terminals Ltd. Coal Handling Infrastructure Upgrade and Expansion entails expansion of metallurgical coal handling systems at an existing terminal at North Vancouver to increase throughput and improve coal handling operations. The project involves the construction of a second railcar dumper at the existing terminal, a conveyor to transport coal from the new dumper to the storage area, replacement of a shiploader boom, and reinforcement of a berth foundation. The new rail dumper will have a floor area of 420 m^2 and a height of 12 m and will be built within the existing terminal footprint. The Neptune Terminal is located at 1001 Low Level Road, North Vancouver, in the Inner Harbour of Burrard Inlet. This development will not involve any in-water works. The increased vessel traffic from the project is expected to be approximately one additional vessel per week. Construction is currently underway and the expected in-service date is November 2014 (PMV 2013c).

The Richardson International Ltd. Grain Storage Capacity project includes installation of approximately 494 open-ended steel wall piles and 315 timber piles, and construction of two 40,000 metric tonne concrete storage annexes at the existing facility. The new infrastructure will have a floor area of 4,550 m^2 and a height of 55 m, and will be built adjacent to the existing grain storage facility located at 375 Low Level Road, North Vancouver, in the Inner Harbour of Burrard Inlet. This development will not involve any in-water works. Construction is currently underway and the expected in-service date is early 2015 (PMV 2013d).

As part of an initiative of the Canadian Government to build new ships for the Royal Canadian Navy and Canadian Coast Guard, construction of the Seaspan ULC (Seaspan) Vancouver Shipyard Improvements project in Seaspan’s Vancouver shipyard located at 10 Pemberton Avenue in North Vancouver (Burrard Inlet) is underway. This project includes construction of several buildings, offices, cranes and other infrastructure, as well as the installation of state-of-the-art equipment (Seaspan 2013). Additional proposed works under the PMV permit review process for the shipyard modernization include construction of a 32 m wide x 50 m long concrete load-out pier with a marine footprint of approximately 1,720 m^2. The pier will be constructed within Seaspan’s water lot lease located on the north shore of the Inner Harbour of Burrard Inlet. Physical works required to construct the pier include: removal of existing concrete ways; installation of temporary containment sheetpile walls; excavation (dredging) within the sheetpile walls; densification of the seabed within the load-out pier footprint (includes installation of timber piles); installation of concrete caissons and infilling; and removal of the temporary sheetpile walls. Dredge material may be disposed of on-land or at sea depending on the results of contaminant analysis. Construction is currently underway and the project is expected to be in-service by early 2015 (PMV 2013e).

The proposed Fraser Surrey Docks Direct Transfer Coal Facility in Surrey entails the development of a direct transfer coal facility at the southwest end of the existing terminal to handle up to 4 million metric tonnes of coal per year. The coal will be transferred by rail to the terminal and will be loaded onto barges at an existing berth. When loaded, tugs will take single barges down to the mouth of the Fraser River. Once barges pass Sand Heads, they will be towed in tandem to Texada Island. From there the coal will be stored before transferring it to a deep-sea vessel for overseas export. The project application is currently under review. Pending regulatory approval, the facility is expected to be operational some time in 2014 (PMV 2013f).

The proposed Lehigh Hanson Materials Ltd. South Richmond Terminal Project entails the development of an aggregate (sand and gravel) processing and distribution facility on leased property owned by PMV in southeast Richmond. Components include a wash plant, aggregate material stockpiles, reclaimer, rail and truck loading facilities, and two marine berths for loading and unloading barges. Several years of site preparation will be required to achieve the necessary ground settlement across the site prior to construction of the facility, which is expected to begin in 2018. Pending regulatory approval, construction is expected to commence from 2014 to 2022 (PMV 2013g).

PMV is proposing to construct and operate the Roberts Bank Terminal 2 Expansion Project. In 2011, PMV moved 2.5 million twenty-foot equivalent unit (TEUs) containers, and forecasts suggest that container traffic is expected to double over the next 10 to 15 years and triple by 2030. The proposed new multi-berth container terminal at Roberts Bank in Delta would provide 2.4 million TEUs of container capacity. The project is part of PMV’s Container Capacity Improvement Program, a long-term strategy to deliver projects to meet anticipated growth in demand for container capacity to 2030. The project is currently in the pre-application phase (field studies are currently underway), with construction anticipated from 2017/2018 to 2024 (PMV 2013h).

Several industrial parks are either proposed or under construction in the Lower Mainland. In fall 2012, construction began on the Maple Ridge Industrial Park, which entails development of 81 ha of land on 203rd Street in Maple Ridge for an industrial park, community garden, park space, trails and community amenities (BC MJTST 2012).

Oil and Gas Exploration and Development Activities

FortisBC is proposing to construct and operate the Kingsvale – Oliver Natural Gas Pipeline Reinforcement Project, which entails looping the existing FortisBC pipeline system between Kingsvale, BC and Oliver, BC over a length of approximately 161 km, as well as a 1 km pipeline extension near Yahk and the addition of compression facilities at Kingsvale, Trail and Yahk (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1c). The project is currently in the pre-application phase, having received BC EAO approval of final Application Information Requirements on December 5, 2012. Pending approval, clearing and construction is anticipated to occur from Q4 2015 to Q4 2016 (Province of BC 2013). Therefore, construction of the Kingsvale – Oliver Natural Gas Pipeline Reinforcement Project is expected to be concurrent with Project construction.

Vancouver Airport Fuel Facilities Corp. is proposing to construct and operate the Vancouver Airport Fuel Delivery Project marine terminal expansion in Richmond along the south arm of the Fraser River, a fuel receiving and storage facility near the marine terminal and a new jet fuel delivery pipeline to YVR (Table 8A.1-6 of Appendix 8.1). The project application is currently under review by the BC EAO. Should approval be granted, construction is estimated to occur over a 24 month period. Since the construction schedule could not be determined, construction of the Vancouver Airport Fuel Delivery Project is assumed to be concurrent with Project construction (Province of BC 2013).

Additional activities in the various RSAs not listed in Appendix 8.1 may include regular pipeline and facility upgrades and maintenance activities.

Mineral Resources

KGHM Ajax Mining Inc. (Ajax) proposes to develop the Ajax Copper/Gold Project (Ajax Project), a new open-pit copper and gold mine near Kamloops with a production capacity of 21.9 million tonnes of ore per year (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1c). The mine's life expectancy is 23 years. The development area is partially within southwest city limits. Project application review will be conducted collaboratively between BC EAO and the CEA Agency. The project is currently in the pre-application stage (Ajax submitted draft Application Information Requirements to BC EAO on January 11, 2012). Pending approval, construction is expected to commence in 2014, with production beginning by 2016 (Province of BC 2013). Therefore, construction of the Ajax Project is assumed to be concurrent with Project construction.

Yellowhead Mining Inc. proposes to develop the Harper Creek Copper-Gold-Silver Project approximately 10 km south of Vavenby (Table 8A.1-1 of Appendix 8.1 and Figure 8.1-1b). This is a proposed open-pit mine with a 28-year mine life based on throughput of 70,000 tonnes/day. Additional infrastructure includes transmission lines, access roads, facilities and storage areas. The mining development is currently moving forward with pre-application activities (final Application Information Requirements submitted to BC EAO on October 21, 2011), including public and stakeholder consultation as well as biophysical and socio-economic studies. Pending regulatory approval, the mine will be constructed over a period of 18 to 24 months, with production expected to begin in late 2016. Therefore, construction of the Harper Creek Copper-Gold-Silver Project is assumed to be concurrent with Project construction.

Construction is currently underway on Teck's $465 million Highland Valley Copper Modernization Project, with the objective of extending the life of the mill and increasing mill capacity (BC MJTST 2012) (Table 8A.1-6 of Appendix 8.1). By mid-2013, an estimated 700 full-time equivalent positions will be required for construction of the new mill (Kamloops Daily News 2013). The modernization project is expected to be complete by late 2013 (BC MJTST 2012).

Several mining developments were identified in the various RSAs in either early development stages (*e.g.*, exploration phase), inactive or on hold, including: the proposed Imperial Metals Corp. Ruddock Creek Zinc-Lead Mine Development Project near Avola; the proposed Discover Corp. Enterprises Inc. Galaxy Mine near Kamloops; the proposed Strongbow Exploration Inc. Shovelnose Mine near Merritt; the Gold Mountain Mining Corp. Elk Gold Mine near Merritt; the proposed New Carolin Gold Corp. Ladner Gold Project near Hope; the proposed North Pacific Alloys Ltd. Cogburn Magnesium Project near Hope; and the proposed Qualark Resources Inc. Hillsbar Aggregate Quarrying Project near Yale. These mining developments are considered to be hypothetical and, therefore, are excluded from the cumulative effects assessment.

8.1.5 Identify Potential Cumulative Effects

The Project's contribution to potential cumulative effects depends on many factors, including:

- the source of the disturbance;
- spatial and temporal boundaries;
- resilience of the receiving environment; and
- the way in which disturbances interact in time and space.

The level of detail provided in the analysis reflects the extent to which a cumulative effect on an environmental element is probable, the likely scale or magnitude of effect, as well as the extent to which these effects can be accurately and reasonably quantified and described relative to the receiving environment.

Many potential residual effects were assessed qualitatively due to a lack of detailed information on reasonably foreseeable developments and the routing of the proposed pipeline adjacent to the existing TMPL right-of-way and other rights-of-way for most of its length. A quantitative approach using GIS (*e.g.*, areal disturbance analysis) was used to inform the assessment of fish and fish habitat, wetlands, vegetation, and wildlife and wildlife habitat.

Quantitative analysis generally focuses on the level of new disturbance resulting from the Project in combination with reasonably foreseeable developments. Recognizing most future developments occur within previously disturbed areas of large urban centres, reasonably foreseeable developments identified within municipal boundaries (*e.g.*, City of Edmonton) were not considered in the quantitative analysis. As mentioned in Section 8.1.4, in an effort to address the agglomeration of municipalities in the Lower Mainland, an LMDA was delineated (Figure 8.1-1c). A concern expressed from a public perspective during ESA Workshop and Community Workshops was the continued protection of valued green space within the LMDA, therefore, future developments identified as encroaching into defined natural spaces that may also be affected by the Project were identified and considered in the quantitative analysis, where appropriate. Only one such development was identified – a portion of the Golden Ears Connector development through a City of Surrey greenbelt, as shown in Figure 8.1-1c and described in Appendix 8.1.

8.1.5.1 Quantitative Analysis Methodology

For those residual effects or elements where a quantitative approach is used to assess potential cumulative effects of the Project, the following parameters are calculated:

- the footprint of existing activities using best available GIS data, supplemented where appropriate by aerial photography or satellite imagery, and the assumptions outlined in Table 8.1-1 below to determine the existing condition in the element-specific LSA or RSA;
- the Footprint of the Project using assumptions provided in Section 2.0 for the various components; and
- the footprint of reasonably foreseeable developments in the element-specific RSA as listed in Table 8A.1-1 to 8A.1-4 of Appendix 8.1 using available project information or, in absence of detailed project information, the assumptions outlined in Table 8.1-1 below.

For those residual effects or elements where a quantitative approach is used to assess potential cumulative effects of the Project, the following information is provided:

- the area attributed to existing activities in the applicable RSA;
- the area attributed to the Project;
- the area attributed to existing activities plus the area attributed to the Project;

- the area attributed to reasonably foreseeable developments in the applicable RSA;
- the total cumulative effect (the area attributed to existing activities plus the area attributed to the Project plus the reasonably foreseeable developments in the applicable RSA); and
- the contribution of the Project to the total cumulative effect (percent).

Cutblocks	Actual size	20	VRI, ABMI

8.1.6 Mitigation Measures

Best management practices implemented to mitigate project-specific effects often limit the potential cumulative environmental effects (Finley and Revel 2002). The goal of mitigation is to attempt to avoid or reduce adverse effects to acceptable or non-significant levels. Mitigation measures are implemented to reduce the impact of any residual effects which may occur including reducing the magnitude of the effect, limiting the extent of the effect and shortening the reversibility of the effect (*i.e.*, time to alleviate the residual effect).

In order to ensure that potential cumulative environmental effects are reduced during Project construction and/or operation of the Project, additional mitigation measures beyond those listed in Section 7.0 are provided, where warranted.

8.1.7 Determination of Significance

The overall cumulative effects on an element and the Project's contribution to these cumulative effects (*i.e.*, cumulative effects of the Project) are described for each applicable element or indicator. The significance of the Project's contribution to cumulative effects is determined in a manner similar to that used to determine the significance of Project-related residual effects as previously outlined in Section 7.1.7 and summarized in Table 7.1-2 with the exception of spatial and temporal boundaries, which are discussed in Sections 7.2 to 7.7.

All significance assessment criteria (*e.g.*, temporal context, magnitude, etc.) listed in Table 7.1-2 applies to cumulative effects and are considered by the assessment team for each cumulative environmental effect.

8.1.8 Cumulative Effects Assessment

Those environmental effects in which adverse residual effects are predicted and are analyzed in the cumulative effects assessment are:

- physical elements such as soils and soil productivity, water quality and quantity, air emissions and acoustic environment;
- biological elements such as fish and fish habitat, wetland loss and alteration, vegetation, wildlife and wildlife habitat, and species at risk; and
- marine physical and biological elements such as marine sediment and water quality, marine fish and fish habitat, marine mammals, marine birds and marine species at risk.

The potential and likely residual effects associated with the construction and operation of the Project on each element are identified in the following subsections along with the identification of existing activities or reasonably foreseeable developments that could act in combination with the Project, as well as the cumulative effect and, if warranted, additional mitigation measures.

Community knowledge and Traditional Ecological Knowledge (TEK) can provide valuable insight in understanding potential impacts of the Project and existing and future developments on current and future use of lands and resources in a given area. Any information gathered through consultation and TEK studies pertaining to the cumulative environmental effects assessment has been incorporated into the assessment of applicable elements for which the information applies.

An evaluation of the significance of the Project's contribution to cumulative effects was conducted. Details of the significance evaluation are also discussed in each of the following subsections.

8.2 Soil and Soil Productivity

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to contribute to cumulative effects on soil and soil productivity indicators that were anticipated to have an adverse combined Project-specific residual effect (*i.e.*, soil productivity and soil degradation).

8.2.1 Reasonably Foreseeable Developments

Tables 8A.1-1 to 8A.1-4 of Appendix 8.1 provide a list of the reasonably foreseeable developments located within the Soil LSA considered in the evaluation of cumulative effects on the soil and soil productivity indicators. Descriptions of these developments are provided in Section 8.1.4 and shown on Figures 8.1-1a to 8.1-1c. In the Soil LSA, there are approximately 14 mapped reasonably foreseeable developments either fully within the Soil LSA or, for some transmission lines and pipelines, partially within the Soil LSA (Table 8A.1-1 of Appendix 8.1). In addition, there are approximately 24 mapped reasonably foreseeable minor oil and gas developments in Alberta: 7 pipelines; 14 facilities; and 3 wells (Tables 8A.1-2 to 8A.1-4 of Appendix 8.1).

As indicated in Section 8.1.4, other reasonably foreseeable developments with the potential to act in combination with the Project were excluded from quantitative evaluations since development details (*e.g.*, approval status, location) were either lacking or the development was located within previously disturbed areas of municipal boundaries, such as the city limits of the City of Edmonton and LMDA. Descriptions of these developments are provided in Section 8.1.4 and Table 8A.1-5 for Alberta and Table 8A.1-6 for BC of Appendix 8.1.

The current level of disturbance due to existing activities within the Soil LSA as well as the anticipated disturbance attributed to the Project and reasonably foreseeable developments is provided in Tables 8.2-1 and 8.2-2. A hierarchy table was applied during the cumulative effects assessment quantitative analysis to determine priority of overlapping land use features (*i.e.*, features with greater indirect footprint and assumed effects potential are assigned higher priority).

Note: 1 The disturbance in the above table does not include the LMDA in BC, but does include the Surrey Greenbelt proposed disturbance.

8.2.2 Potential Cumulative Effects

The potential and likely combined environmental residual effects associated with the construction and operation of the Project on soil and soil productivity indicators were identified in Section 7.11.1.2 and are listed in Table 8.2-3 along with existing activities and reasonably foreseeable developments that could act in combination with the Project. No residual effects were identified for the indicator of soil contamination in Section 7.11.1.2 and, therefore, this indicator was not assessed for cumulative effects.

TABLE 8.2-3

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON SOIL AND SOIL PRODUCTIVITY CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Combined Project effects on soil productivity.	LSA	Pipeline Temporary Facilities Pump Stations Tanks Westridge Marine Terminal Pipeline Reactivation	Construction to Operation	Project contribution to cumulative change in soil productivity.	• Existing activities including: agriculture and livestock grazing, forestry activities, rural and urban residential and commercial development, transportation and infrastructure development, utility activities, oil and gas exploration and development, and mineral resource exploration and development. • Reasonably foreseeable developments within the Soil LSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including topsoil/root zone material salvaging, grading, trenching, backfilling and reclamation.

3. Combined Project effects on bedrock and stone disposal.	LSA	Pipeline	Construction to Operation	N/A	• No projects/activities with residual effects acting in combination with the Project have been identified.

Note: 1 LSA = Soil LSA.

8.2.3 Significance Evaluation of Potential Cumulative Effects

A quantitative approach was selected to determine the cumulative effect of the Project on soil productivity since the change to this parameter over existing conditions can be quantified. However, where there are no standards, guidelines, objectives or other established and accepted ecological thresholds to define quantitative rating criteria or where quantitative thresholds are not appropriate, the qualitative method that is based on available research literature and professional judgment is considered to be the appropriate method for determining the significance of the anticipated Project's contribution to cumulative environmental effects. Consequently, the qualitative assessment of soil and soil productivity is considered to be the most appropriate method with the evaluation of significance of Project's contribution to cumulative effects relying on the professional judgment of the assessment team.

Table 8.2-4 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on soil and soil productivity indicators. The rationale used to evaluate the significance of each of the cumulative effects is provided below.

TABLE 8.2-4

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON SOIL AND SOIL PRODUCTIVITY

Potential Cumulative Effects	Impact Balance	Spatial Boundary[1]	Temporal Context: Duration	Temporal Context: Frequency	Temporal Context: Reversibility	Magnitude	Probability	Confidence	Significance[2]
1. Soil Indicator – Soil Productivity									
1(a) Project contribution to cumulative change in soil productivity.	Negative	LSA	Short-term	Periodic	Short to medium-term	Low	High	High	Not significant
2. Soil Indicator – Soil Degradation									
2(a) Project contribution to cumulative change in soil degradation.	Negative	LSA	Short-term	Periodic	Short to medium-term	Low	High	High	Not significant

TABLE 8.2-4 Cont'd

Potential Cumulative Effects	Impact Balance	Spatial Boundary[1]	Temporal Context: Duration	Temporal Context: Frequency	Temporal Context: Reversibility	Magnitude	Probability	Confidence	Significance[2]
3. Project Contribution to Combined Cumulative Effects on Soil and Soil Productivity									
3(a) Project contribution to cumulative effects on the soil and soil productivity indicators (1[a] and 2[a]).	Negative	LSA	Short-term	Periodic	Short to medium-term	Low	High	High	Not significant

Notes: 1 LSA = Soil LSA.

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.2.3.1 Soil Indicator – Soil Productivity

Chernozems and Solonetzs are the dominant soil orders encountered along the proposed pipeline corridor in Alberta and Brunisols, Luvisols, Podzols, Gleysols and Chernozems are the dominant soil orders in BC (Natural Regions Committee 2006, Valentine *et al.* 1978). Lands traversed by the proposed pipeline corridor are agricultural, disturbed by plowing for cultivation, hay and tame pasture, areas of aspen woodlands and mixed aspen forest, treed pasture, native vegetation, urban, industrial and parks.

Since surface disturbances can affect soil productivity, existing activities, the Project and reasonably foreseeable developments (as identified in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1) will act cumulatively to affect soils in the Soil LSA. Soil productivity within the Soil LSA has been altered in the past due to existing activities such as agriculture and livestock grazing, forestry activities, rural and urban residential and commercial developments, transportation and infrastructure, utility activities, oil and gas activities (including ongoing pipeline maintenance programs), and mineral resource exploration and development.

The likely potential residual effects that may contribute to cumulative change in soil productivity in the Soil LSA include: admixing; changes in evaporation and transpiration rates; use of sand as bedding and padding material; and excessive trench subsidence or remnant crown. Admixing may occur during construction of the proposed pipeline, temporary facilities, at pump stations where new land is required, at the Sumas Terminal, Westridge Marine Terminal and during reactivation activities along existing pipeline segments. The remainder of the likely residual effects are expected to occur during construction of the proposed pipeline only.

Approximately 39,791.3 ha (38.9%) of the soils in the Soil LSA have been affected through surface disturbance associated with existing activities (Tables 8.2-1 and 8.2-2). When combined with the Project and reasonably foreseeable developments, the total cumulative disturbance of soil in the Soil LSA is predicted to be 42,189 ha which increases the percentage of disturbed soils in the Soil LSA to 41.3%. Most of the additional disturbance to soils in the Soil LSA is attributed to transmission lines in Alberta and quarries, mines and aggregates in BC. The Project contributes 2% (2,058.3 ha) to the total cumulative disturbance of soil.

Future developments such as oil and gas wells, facilities and pipelines are likely to act cumulatively with the Project to decrease soil productivity. Soils disturbed by pipeline developments will be replaced following clean-up, whereas wells and facilities are salvaged of topsoil/root zone material for the operational life of the development. Other future developments that have the potential to act cumulatively on soil productivity are agriculture and livestock grazing, forestry activities, rural and urban residential and commercial development, transportation and infrastructure development, utility activities and mineral resource exploration and development. Public, tourism, arts and recreation developments and activities, and marine developments are not expected to cumulatively affect soil productivity. Participants of several of the Community Workshops (*e.g.*, Kamloops, Clearwater, Edmonton and Langley) noted the importance of proper management of topsoil, including handling and separation procedures, and emphasized that the rooting depth of soil is important for soil productivity on agricultural lands.

The Project's contribution to cumulative change in soil productivity will be reduced by following mitigation provided in Table 7.2.2-2 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D). It is expected that other developments will implement mitigation measures similar to those implemented for the Project that have been developed in accordance with industry and provincial regulatory guidelines for soil conservation. Further to this, it is anticipated that best management practices for soil conservation within the agricultural industry will generally be implemented by farmers and ranchers within the Soil LSA. No mitigation measures beyond the Project-specific mitigation already proposed for soil and soil productivity indicators in Section 7.0 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D) are deemed warranted.

The cumulative effect on soil productivity in the Soil LSA is considered to have a negative impact balance. The Project's contribution to this cumulative effect is expected to be reversible in the short to medium-term since soils are expected to approximate pre-disturbance productivity within a few years, as demonstrated by post-construction environmental monitoring programs for past pipeline projects (TERA 2009a,b, 2011a,b,c, 2012, 2013a,b). Although total soil disturbance will increase, the magnitude is considered to be low since most of the proposed pipeline corridor parallels the existing TMPL right-of-way or other linear disturbances, and mitigation measures are to be implemented for soil conservation (Table 8.2-4, point 1[a]). A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on soil productivity is provided below.

- Spatial Boundary: Soil LSA – Project disturbance will be confined to the Soil LSA and this contribution to cumulative effects will not extend beyond the LSA.
- Duration: short-term – the Project events resulting in surface disturbance that contribute to cumulative effects are limited to construction and ongoing pipeline maintenance, the period of which is less than 1 year.
- Frequency: periodic – Project activities that result in surface disturbance that could contribute to cumulative effects could occur intermittently, but repeatedly over the assessment period for maintenance activities.
- Reversibility: short to medium-term – effects on soils are expected to approximate pre-disturbance productivity in less than 10 years.
- Magnitude: low – although the Project will contribute to a change in soil productivity in the Soil LSA, the estimated change in soil productivity is of limited areal extent and the Project's contribution will be reduced through the implementation of mitigation measures.
- Probability: high – a change in soil productivity is likely to occur as a result of the Project acting in combination with existing activities and reasonably foreseeable developments.
- Confidence: high – based on a good understanding by the assessment team of cause-effect relationships between construction activities and soil productivity.

8.2.3.2 Soil Indicator – Soil Degradation

Surface disturbances can affect soil degradation and, therefore, existing activities, the Project and reasonably foreseeable developments (as identified in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1) will act cumulatively to affect soils in the Soil LSA. Soil degradation within the Soil LSA has occurred in the past due to existing activities such as agriculture and livestock grazing, forestry activities, rural and urban residential and commercial developments, transportation and infrastructure, utility activities, oil and gas activities (including ongoing pipeline maintenance programs), and mineral resource exploration and development.

The likely potential residual effects from the construction of the pipeline and temporary facilities that may contribute to cumulative change in soil degradation in the Soil LSA include compaction and rutting, surface erosion and pulverization of soil. Compaction and rutting, surface erosion and pulverization may also occur during construction of temporary facilities, pump stations, tank terminals, Westridge Marine Terminal and during pipeline reactivation activities.

The results of the quantitative analysis of areal disturbance in the Soil LSA from existing disturbance, Project disturbance and disturbance from other activities is provided in Tables 8.2-1 and 8.2-2 and discussed in Section 8.2.3.1.

Future developments such as oil and gas wells, facilities and pipelines are likely to act cumulatively with the Project to increase soil degradation. Soils disturbed by pipeline developments will be replaced following clean-up, whereas topsoil/root zone material is salvaged from wells and facilities for the operational life of the development. Other future developments that have the potential to act cumulatively on soil degradation are agriculture and livestock grazing, forestry activities, rural and urban residential and commercial development, transportation and infrastructure development, utility activities and mineral resource exploration and development. Public, tourism, arts and recreation developments and activities, and marine developments are not expected to cumulatively impact soil degradation. Soil erosion was noted as a concern by stakeholders, including participants of the Wabamun, Hinton, Valemount and Kamloops Community Workshops.

The Project's contribution to cumulative change in soil productivity will be reduced by following mitigation provided in Table 7.2.2-2 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D). It is expected that the other developments will implement mitigation measures similar to those implemented for the Project that have been developed in accordance with industry and provincial regulatory guidelines for soil conservation. Further to this, it is anticipated that best management practices for soil conservation within the agricultural industry will generally be implemented by farmers and ranchers within the Soil LSA. No mitigation measures beyond the Project-specific mitigation already proposed for soil and soil productivity indicators in Section 7.0 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D) are deemed warranted.

The cumulative effect on soil degradation in the Soil LSA is considered to have a negative impact balance. The cumulative effect is expected to be reversible in the short to medium-term since issues related to soil degradation can generally be resolved within one to three years following final clean-up, as demonstrated by post-construction environmental monitoring programs for past pipeline projects (TERA 2009a,b, 2011a,b,c, 2012, 2013a,b). Given the proven effectiveness of the mitigation measures to reduce the severity of soil degradation issues (*i.e.*, compaction and rutting, erosion and pulverization), the magnitude is considered to be low (Table 8.2-4, point 2[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on soil degradation is provided below.

- Spatial Boundary: Soil LSA – Project disturbance will be confined to the Soil LSA and this contribution to cumulative effects will not extend beyond the LSA.
- Duration: short-term – the Project events resulting in surface disturbance that contribute to cumulative events are limited to construction and ongoing pipeline maintenance, the period of which is less than 1 year.
- Frequency: periodic – Project activities that result in surface disturbance that could contribute to cumulative effects could occur intermittently, but repeatedly over the assessment period for maintenance activities.
- Reversibility: short to medium-term – issues related to soil degradation are anticipated to be resolved in less than 10 years.
- Magnitude: low – the Project will contribute to a change in soil degradation in the Soil LSA and this contribution will be reduced through the implementation of mitigation measures.
- Probability: high – a change in soil degradation is likely to occur as a result of the Project acting in combination with existing activities and reasonably foreseeable developments.
- Confidence: high – based on a good understanding by the assessment team of cause-effect relationships between construction activities and soil degradation.

8.2.3.3 Combined Effects on Soil and Soil Productivity

The potential cumulative effects (*i.e.*, change in soil productivity and soil degradation) may act in combination to affect soil and soil productivity in the Soil LSA. The impact balance is considered negative. The implementation of mitigation measures described in Section 7.0 will reduce the severity of cumulative effects arising from the Project in combination with other reasonably foreseeable developments. The combined cumulative effect of the Project on soil and soil productivity is of low magnitude, reversible in the short to medium-term and of high probability (Table 8.2-4, point 3[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects of the Project on the soil and soil productivity indicators is provided below.

- Spatial Boundary: Soil LSA – Project disturbance will be confined to the LSA and this contribution to cumulative effects will not extend beyond the LSA.
- Duration: short-term – the Project events resulting in surface disturbance that contribute to cumulative effects are limited to construction and ongoing pipeline maintenance, the period of which is less than 1year.
- Frequency: periodic – Project activities that result in surface disturbance that could contribute to cumulative effects could occur intermittently, but repeatedly over the assessment period due to maintenance activities.
- Reversibility: short to medium-term – effects on soil and soil productivity are expected to approximate pre-disturbance in less than 10 years.
- Magnitude: low – the Project will contribute to a change in soil and soil productivity in the Soil LSA, but this contribution will be reduced through the implementation of mitigation measures.
- Probability: high – a change in soil and soil productivity is likely to occur as a result of the Project acting in combination with existing activities and reasonably foreseeable developments.
- Confidence: high – based on a good understanding by the assessment team of cause-effect relationships between construction activities and soil and soil productivity.

8.2.4 Summary

As identified in Table 8.2-4, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on soil and soil productivity within the Soil LSA will be not significant.

8.3 Water Quality and Quantity

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to contribute to cumulative effects on water quality and quantity indicators that were anticipated to have an adverse combined Project-specific residual effect (*i.e.*, surface water quality and surface water quantity).

Relevant regulatory guidelines, ATK, TEK, ecological context and residual Project effects were considered in the characterization of potential cumulative effects for surface water quality and quantity indicators. Concerns from Aboriginal communities identified during engagement for other development projects were raised with regard to cumulative effects of pipeline construction at watercourse crossings such as turbidity and water quality and quantity (Lifeways of Canada Ltd. 2012, Northern Gateway Pipelines Ltd. Partnership 2010). Additional information on TEK collected during field studies for the Project is provided in the Fisheries (Alberta) Technical Report and Fisheries (BC) Technical Report of Volume 5C.

8.3.1 Reasonably Foreseeable Developments

Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 provide a list of the certain and reasonably foreseeable developments located within the Aquatics RSA in the evaluation of cumulative effects on the water quality and quantity indicators. Description of these developments is provided in Section 8.1.4, and developments in Tables 8A.1-1 to 8A.1-4 are shown on Figures 8.1-1a, 8.1-1b and 8.1-1c. Reasonably foreseeable developments provided in Table 8A.1-5 (for Alberta) and Table 8A.1-6 (for BC) of Appendix 8.1 with the potential to act in combination with the Project were excluded from mapping since development details (*e.g.*, approval status, location) were either not available or the developments were located within urban municipal boundaries, such as the City of Edmonton and LMDA.

In the Aquatics RSA, there are approximately 68 mapped reasonably foreseeable developments either fully within the Aquatics RSA or, for some transmission lines and pipelines, partially within the Aquatics RSA (Table 8A.1-1 of Appendix 8.1). In addition, there are approximately 2,387 mapped reasonably foreseeable minor oil and gas developments in Alberta: 502 pipelines; 1,617 facilities; and 268 wells (Tables 8A.1-2, 8A.1-3 and 8A.1-4 of Appendix 8.1).

8.3.2 Potential Cumulative Effects

The potential and likely combined residual effects associated with the construction and operation of the Project on water quality and quantity indicators were identified in Section 7.11.1.3. These effects are listed in Table 8.3-1 along with existing activities and reasonably foreseeable developments that could act in combination with the Project. A cumulative effects assessment is not deemed warranted as per Section 8.1.1 for combined potential residual effects determined to be of low probability, therefore, a cumulative effects assessment for groundwater quality and quantity is not required.

TABLE 8.3-1

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON WATER QUALITY AND QUANTITY CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Combined Project effects on surface water quality.	RSA	Pipeline Temporary Facilities Pump Stations (power lines) Tanks Pipeline Reactivation	Construction to Operation	Project contribution to cumulative change in surface water quality.	• Existing activities including: agriculture and livestock grazing, forestry, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including clearing, topsoil/root zone material salvaging, grading, trenching, backfilling and reclamation of approaches to water crossings, vehicle crossing installation and removal, bank reclamation, and pump station and facility operations.
2. Combined Project effects on surface water quantity.	RSA	Pipeline Temporary Facilities Pump Stations Tanks Westridge Marine Terminal Pipeline Reactivation	Construction to Operation	Project contribution to cumulative change in surface water quantity.	• Existing activities including: agriculture and livestock grazing, forestry, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including clearing, topsoil/root zone material salvaging, grading, trenching, backfilling and reclamation of approaches to water crossings, vehicle crossing installation and removal, bank reclamation, and pump station and facility operations.

Note: 1 RSA = Aquatics RSA.

8.3.3 Significance Evaluation of Potential Cumulative Effects

Where there are no standards, guidelines, objectives or other established and accepted ecological thresholds to define quantitative rating criteria or where quantitative thresholds are not appropriate, the qualitative method is considered to be the appropriate method for determining the significance of the anticipated Project's contribution to cumulative environmental effects. Consequently, a qualitative assessment of water quality and quantity was determined to be the most appropriate method with the evaluation of significance of the Project's contribution to cumulative effects relying on the professional judgment of the assessment team.

Table 8.3-2 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on water quality and quantity indicators. The rationale used to evaluate the significance of each of the cumulative effects is provided below.

TABLE 8.3-2

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON WATER QUALITY AND QUANTITY

	Potential Cumulative Effects	Impact Balance	Spatial Boundary[1]	Temporal Context			Magnitude	Probability	Confidence	Significance[2]
				Duration	Frequency	Reversibility				
1.	Water Quality and Quantity Indicator – Surface Water Quality									
1(a)	Project contribution to cumulative change in surface water quality.	Negative	RSA	Short-term	Isolated to occasional	Immediate to medium-term	Low to medium	High	High	Not significant
2.	Water Quality and Quantity Indicator – Surface Water Quantity									
2(a)	Project contribution to cumulative change in surface water quantity.	Negative	RSA	Short-term	Isolated to occasional	Short-term to permanent	Low to medium	High	High	Not significant
3.	Project Contribution to Combined Cumulative Effects on Water Quality and Quantity									
3(a)	Project contribution to combined cumulative effects on the water quality and quantity indicators (1[a] and 2[a]).	Negative	RSA	Short-term	Isolated to occasional	Short-term to permanent	Low to medium	High	High	Not significant

Notes: 1 RSA = Aquatics RSA.

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.3.3.1 Water Quality and Quantity Indicator – Surface Water Quality

Surface water quality is highly variable within the Aquatics RSA. As indicated in Section 7.2.3, construction and operation of the Project is not likely to result in an increase of water quality parameters such as heavy metals, bacteria, nutrients and pesticides. Therefore, since the cumulative effects assessment only considers potential residual effects that are likely to occur, the only Project contribution to cumulative change in surface water quality is attributed to increased suspended sediment loads and turbidity, which is considered to have a negative impact balance. Potential residual effects that may contribute to cumulative increases in suspended sediment loads and turbidity in the Aquatics RSA include: instream construction at trenched crossings; erosion from banks and approach slopes; construction and operation of temporary access roads and borrow sites; construction and operation of the Black Pines and Kingsvale power lines; and construction and operation of new storage tanks at the Burnaby Terminal.

In the Aquatics RSA, past developments and existing activities and land uses responsible for increased sediment inputs are predominantly associated with agricultural runoff and livestock grazing (*e.g.*, trampling along banks), oil and gas development (predominantly in Alberta) and forestry (predominantly in BC). Other developments and activities near waterbodies and watercourses such as rural and urban residential and commercial development, transportation infrastructure and development, utility activities, and mineral resource exploration and development, also have the potential to contribute to increase TSS and turbidity levels within the Aquatics RSA.

Most reasonably foreseeable developments listed in Appendix 8.1 will typically be sited well away from waterbodies and, therefore, are not likely to act cumulatively with the Project to reduce surface water quality. Other reasonably foreseeable developments that may be sited near waterbodies listed in Appendix 8.1 are not likely to act cumulatively with the Project to reduce surface water quality because they will be constructed before the Project and any sedimentation is likely to be flushed away as a result of spring freshet prior to Project construction. Nevertheless, certain reasonably foreseeable developments such as pipelines (Tables 8A.1-1 and 8A.1-2 of Appendix 8.1), hydroelectric projects (Table 8A.1-1 of Appendix 8.1) and infrastructure developments (Tables 8A.1-1, 8A.1-5 and 8A.1-6 of Appendix 8.1) have the potential to reduce surface water quality once operational or in-service due to, for example, increased site and road runoff and subsequent erosion.

Construction activities within the Aquatics RSA taking place concurrently with construction of the Project have the greatest potential to cause a cumulative impact to water quality within the Aquatics RSA. Reasonably foreseeable developments in the Aquatics RSA of Alberta with concurrent construction schedules having potential to increase TSS and turbidity include the Grand Rapids Pipeline Project, Northern Gateway Project, Polaris Expansion Project – Edmonton Extension and Robb Trend Project (Figure 8.1-1a and Table 8A.1-1 of Appendix 8.1), as well as the Northeast Anthony Henday Project and Southeast to West LRT (Valley Line) Project (Table 8A.1-5 of Appendix 8.1). Reasonably foreseeable developments in the Aquatics RSA of BC with concurrent construction schedules having potential to increase TSS and turbidity include the Ajax Project, Kingsvale – Oliver Natural Gas Pipeline Reinforcement Project, Harper Creek Copper-Gold-Silver Project, Castle Creek Hydropower Project, Morkill River Hydroelectric Project, Thretheway, Shovel and Big Silver Creeks Hydroelectric Project (Figures 8.1-1b and 8.1-1c, and Table 8A.1-1 of Appendix 8.1), as well as the Vancouver Airport Fuel Delivery Project, Skytrain – Evergreen Line Rapid Transit Project, Skytrain – Expo Line Upgrade Strategy, Roberts Bank Rail Corridor – Grade Separation and Improvements, Capilano (Cleveland) Dam Powerplant and Ruskin Dam Safety and Powerhouse Upgrade (Table 8A.1-6 of Appendix 8.1).

The Project's contribution to cumulative increases in total suspended sediment (TSS) and turbidity will be reduced by following mitigation provided in Section 7.0 for the surface water quality indicator and the Pipeline and Facilities EPPs (Volumes 6B and 6C). It is expected that most other reasonably foreseeable developments will implement mitigation measures similar to those recommended for the Project that have been developed in accordance with industry and provincial regulatory guidelines for surface water quality. It is also expected that best management practices will be implemented by many farmers, ranchers and other land users to prevent sedimentation of waterbodies associated with agricultural activities within the Aquatics RSA. No mitigation measures beyond the Project-specific mitigation already proposed for surface water quality indicators in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed warranted.

As demonstrated by post-construction environmental monitoring programs for past pipeline projects (TERA 2009a,b, 2011a,b,c, 2012, 2013a,b), the Project's contribution to the cumulative effect on surface water quality within the Aquatics RSA is expected to be reversible immediately to short-term, from increased suspended sediment due to upstream construction at select watercourses, and short to medium-term once the watercourse crossings are completed and vegetation is established on the approach slopes and banks, runoff conveyance structures are in place, and effective sediment control measures are taken to reduce erosion and subsequent sedimentation of watercourses. The potential cumulative effect is considered to be of low to medium magnitude depending on the amount of sediment released acting cumulatively with sediment from existing activities near watercourses, and with sediment from reasonably foreseeable developments (Table 8.3-2, point 1[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on surface water quality is provided below.

- Spatial Boundary: Aquatics RSA – the Project's contribution to combined sediment load and turbidity may interact with reasonably foreseeable developments within the Aquatics RSA to cause a cumulative alteration to water quality in the RSA.

- Duration: short-term – the Project's contribution to cumulative changes in sediment load and turbidity would occur during the construction phase or associated with maintenance activities within any 1 year during the operations phase (*i.e.*, short-term).
- Frequency: isolated to occasional – Project activities that could contribute to cumulative reduction in surface water quality may occur intermittently, but repeatedly over the assessment period due to maintenance activities.
- Reversibility: immediate to medium-term – the Project's contribution to the cumulative effect is expected to be reversible immediately (*e.g.*, increased suspended sediment due to upstream construction at select watercourses) or may take more than a year after the watercourse crossing is completed and effective sediment control measures are established, such as installation of runoff conveyance structures and revegetation of approach slopes and banks. This could require more than 1 year.
- Magnitude: low to medium – established industry best practices will generally reduce the Project's contribution to combined sediment load to low magnitude, but contingency crossing methods, if required, could result in medium magnitude contributions.
- Probability: high – since it is likely that existing activities, the Project and reasonably foreseeable developments will act cumulatively to reduce surface water quality during construction.
- Confidence: high – based on the professional experience of the assessment team.

8.3.3.2 Water Quality and Quantity Indicator – Surface Water Quantity

The Project's contribution to cumulative change in surface water quantity resulting from alteration of natural surface drainage patterns and alteration of natural streamflow from instream activities is considered to have a negative impact balance.

In the Aquatics RSA, past developments and existing activities and land uses responsible for changes in surface water quantity are predominantly associated with water use and altered drainage patterns from agriculture, oil and gas development (predominantly in Alberta), rural and urban residential and commercial development, mineral resource development, hydroelectric development and forestry (predominantly in BC). Other developments and activities such as forestry (predominantly in BC) and transportation infrastructure and development can contribute to changes in surface water quantity predominantly through altered surface drainage patterns and water balance. Streamflow patterns have also been altered in the Aquatics RSA by existing developments such as canals, ditches and other conveyance structures associated with agricultural and rural and urban residential and commercial development. Pipeline and utility crossings (predominantly in Alberta) and hydroelectric developments (predominantly in BC) have also impacted streamflow of many watercourses within the Aquatics RSA.

Most reasonably foreseeable developments listed in Appendix 8.1 will typically be sited well away from waterbodies and, therefore, are not likely to act cumulatively with the Project to alter streamflow. However, many of the pipeline projects in Tables 8A.1-1 and 8A.1-2 of Appendix 8.1 are likely to implement trenched crossing techniques that may result in brief alteration of streamflow from instream construction activities. Many hydroelectric developments in Tables 8A.1-1 and 8A.1-6 of Appendix 8.1 are likely to alter streamflow as well through diversion and instream construction activities, resulting in medium to long-term effects that would still act in combination with the Project to alter streamflow patterns until watercourses crossed by the Project are fully stabilized and natural streamflow is re-established.

Alteration of natural drainage patterns is likely to result from most reasonably foreseeable developments in Tables 8A.1-1 to 8A.1-6 where new land is required or where surface alteration results in increased stormwater discharge. The reversibility of this residual effect varies from short-term to permanent for reasonably foreseeable developments depending on the type of development. For example, pipeline and transmission line developments may be reversed in the short to medium-term while residual effects from above ground facilities may be long-term or permanent until pre-construction contours are restored following decommissioning and abandonment. Reasonably foreseeable developments, such as the Robb Trend Project, Vista Project and Ajax Project (Figures 8.1-1a and 8.1-1b, and Table 8A.1-1 of

Appendix 8.1) will result in permanent alteration of natural drainage patterns since pre-construction contours will not be fully restored following decommissioning and abandonment. Consequently, many developments constructed prior to or after the Project may still act in combination with the Project to alter future drainage patterns. In some instances, such as at the Burnaby Terminal, the contribution of the Project or other reasonably foreseeable development may contribute to a permanent cumulative alteration of drainage patterns. However, given the limited extent of permanent alteration at the Burnaby Terminal, the magnitude of the Project's contribution to any cumulative permanent alternation of natural drainage patterns in the Aquatics RSA is considered low.

Project contribution to changes in surface water quantity will be reduced by following mitigation provided in Section 7.0 for the surface water quantity indicator and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D). It is expected that many other reasonably foreseeable developments will implement mitigation measures similar to those recommended for the Project that have been developed in accordance with industry and provincial regulatory guidelines for surface water quantity. It is also expected that best management practices will be implemented by many municipalities, landowners and industry to reduce water needs within the Aquatics RSA. No mitigation measures beyond the Project-specific mitigation already proposed for surface water quantity indicators in Section 7.0 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D) are deemed warranted.

The Project contribution to the cumulative effect on surface water quantity within the Aquatics RSA is expected to be reversible in the short to long-term or permanent depending on the Project component (*e.g.*, short to medium-term for the pipeline once watercourse bed and banks are fully stabilized and trench crown settles and long-term to permanent for above ground facilities depending whether natural drainage patterns can be restored following decommissioning and abandonment). The potential cumulative effect is considered to be of low to medium magnitude since Project contribution to changes in surface water quantity is considered to be minor in relation to changes to surface water quantity resulting from existing activities and reasonably foreseeable developments in the Aquatics RSA (Table 8.3-2, point 2[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on surface water quantity is provided below.

- Spatial Boundary: Aquatics RSA – the Project's contribution to combined disturbance may interact with reasonably foreseeable developments within the Aquatics RSA to cause a cumulative alteration to water quantity in the RSA.
- Duration: short-term – the Project's contribution to cumulative changes in water quantity would occur during the construction phase or associated with maintenance activities within any one year during the operations phase (*i.e.*, short-term).
- Frequency: isolated to occasional – Project activities that could contribute to cumulative changes in surface water quantity may occur intermittently, but repeatedly over the assessment period due to maintenance activities.
- Reversibility: short-term to permanent – the Project's contribution to the cumulative effect is expected to be reversed in the short to medium-term following construction of the pipeline and power lines and long-term to permanent for above ground facilities depending whether natural drainage patterns can be restored following decommissioning and abandonment.
- Magnitude: low to medium – the Project's contribution to cumulative effects on the surface water quantity indicator are anticipated to be largely mitigated during construction and relatively minor.
- Probability: high – since it is likely that existing activities, the Project and reasonably foreseeable developments will act cumulatively to cause changes to water quantity.
- Confidence: high – based on the professional experience of the assessment team.

8.3.3.3 Combined Cumulative Effects on Water Quality and Quantity

Combined Effects of the Project on Water Quality and Quantity

Past and reasonably foreseeable developments plus the Project (*i.e.*, the Project's contribution to cumulative change in surface water quality and quantity) may act in combination to affect water quality and quantity in the Aquatics RSA. The impact balance is considered negative. The implementation of mitigation measures described in Section 7.0 will reduce the severity of cumulative effects arising from the Project in combination with other reasonably foreseeable developments. The combined cumulative effect of the Project on water quality and quantity is of low to medium magnitude, reversible in the short-term to permanent and of high probability (Table 8.3-2, point 3[a]). A summary of the rationale for all of the significance criteria for the combined cumulative effects of the Project on the water quality and quantity indicators is provided below.

- Spatial Boundary: Aquatics RSA – the Project may interact with existing activities and reasonably foreseeable developments within the Aquatics RSA to cause a combined cumulative alteration to water quality and quantity in the RSA.
- Duration: short-term – the Project activities that contribute to cumulative effects on the water quality and quantity indicators will occur during construction and operations (*e.g.*, maintenance activities) of various Project components.
- Frequency: isolated to occasional – Project activities that could contribute to cumulative effects on the water quality and quantity indicators are generally confined to the construction period but may occur intermittently and sporadically during the operations phase.
- Reversibility: short-term to permanent – the events causing combined cumulative effects on the water quality and quantity indicators will vary, where Project contribution from certain residual effects may be reversed shortly after construction, others may not fully be reversed until reclamation and post-construction environmental monitoring or, for above ground facilities, decommissioning and abandonment (depending whether natural drainage patterns can be restored following decommissioning and abandonment).
- Magnitude: low to medium – the Project's contribution to combined cumulative effects on the water quality and quantity indicators is anticipated to be largely mitigated during construction and operations.
- Probability: high – alteration of water quality and quantity is likely to occur as a result of the Project acting in combination with existing activities and reasonably foreseeable developments.
- Confidence: high – based on a good understanding by the assessment team of cause-effect relationships between construction activities of the Project and reasonably foreseeable developments on water quality and quantity.

8.3.4 Summary

As identified in Table 8.3-2, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on water quality and quantity within the Water Quality and Quantity LSA and Aquatics RSA will be not significant.

8.4 Air Emissions

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to cumulatively affect air emissions indicators that were anticipated to have an adverse combined Project-specific residual effect (*i.e.*, criteria air contaminants [CACs] and volatile organic compounds [VOCs]).

During normal pipeline operations and after construction of the Project, fugitive air emissions from the pipeline, which consists of welded steel sections, are expected to be nil. As noted in Section 7.4, fugitive emissions from pump stations were shown to be negligible and the extent and magnitude of the predicted impacts was shown to be negligible. Other Project components such as storage tank facilities at the Edmonton, Kamloops, Sumas and Burnaby terminals, and the Westridge Marine Terminal will continue to release fugitive emissions from product handling and storage. Other emissions from reasonably foreseeable developments in the Air Quality RSA have the potential to combine with existing emissions and Project-related fugitive emissions from tank terminals and tanker loading and stationary point sources such as the vapour combustion unit, to create a cumulative effect.

8.4.1 Reasonably Foreseeable Developments

Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 provide a list of the certain and reasonably foreseeable developments located within the Air Quality RSA considered in the evaluation of cumulative effects on the air quality indicators. Description of these developments is provided in Section 8.1.4, and developments in Tables 8A.1-1 to 8A.1-4 are shown on Figures 8.1-1a, 8.1-1b and 8.1-1c. Reasonably foreseeable developments provided in Table 8A.1-5 (for Alberta) and Table 8A.1-6 (for BC) of Appendix 8.1 with the potential to act in combination with the Project were excluded from mapping since development details (*e.g.*, approval status, location) were either not available or the developments were located within urban municipal boundaries, such as the City of Edmonton and LMDA.

In the Air Quality RSA, there are approximately 18 mapped reasonably foreseeable developments either fully within the Air Quality RSA or, for some transmission lines and pipelines, partially within the Air Quality RSA (Table 8A.1-1 of Appendix 8.1). In addition, there are approximately 164 mapped reasonably foreseeable minor oil and gas developments in Alberta: 49 pipelines; 95 facilities; and 20 wells (Tables 8A.1-2, 8.A1-3 and 8A.1-4 of Appendix 8.1).

8.4.2 Potential Cumulative Effects

The potential and likely combined environmental residual effects associated with the construction and operation of the Project on air emissions indicators were identified in Section 7.11.1.4 and are listed in Table 8.4-1 along with existing activities and reasonably foreseeable developments that could act in combination with the Project.

No new odour emissions or residual effects for the indicators of odour such as chemicals like H_2S and mercaptans were identified. Therefore, the combined cumulative effects for this air indicator remains unchanged from the significance evaluation summarised in Table 7.11.1-4 and was not carried forward into the cumulative effects assessment.

TABLE 8.4-1

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON AIR EMISSIONS CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Note: 1 RSA = Air Quality RSA; LFV = Lower Fraser Valley.

8.4.3 Significance Evaluation of Potential Cumulative Effects

A qualitative approach was selected to evaluate significance of the Project's contribution to cumulative effects on air quality since emissions data for reasonably foreseeable developments were largely unavailable. Due to a lack of regulatory thresholds, standards or guidelines relating to air emissions, the evaluation of significance relied on the professional judgment of the assessment team.

Table 8.4-2 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on air emission indicators. The rationale used to evaluate the significance of each of the cumulative effects is provided below.

TABLE 8.4-2

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON AIR EMISSIONS

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.4.3.1 Air Emissions Indicator – Criteria Air Contaminants and Volatile Organic Compounds

Increased Air Emissions during Construction and Site-Specific Maintenance Activities

Existing sources of increased air emissions in the Air Quality RSA include vehicle emissions arising from agriculture and forestry activities involving equipment use (*e.g.*, cultivation, logging trucks), oil and gas exploration and development, utility activities (*e.g.*, maintenance on transmission lines), transportation activities (*e.g.*, road construction and maintenance), and mineral exploration and development. The aforementioned activities also have the potential to cause increased dust emissions from ground disturbance and road use, and some activities involving clearing (*e.g.*, forestry, agriculture, oil and gas development) may cause increased smoke from burning of slash. The construction of the pipeline, temporary facilities, tanks and pumps stations and, to a lesser extent, pipeline reactivation and operations activities (*e.g.*, vegetation management, routine inspections, site-specific maintenance) will increase air emissions. All of these activities are expected to be short-term events. The construction and/or operations of reasonably foreseeable developments (as identified in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1) will also increase air emissions.

The Project will act in combination with existing activities and reasonably foreseeable developments in the Air Quality RSA to increase air emissions during construction of the Project and operations activities such as vegetation management, routine inspections and site-specific maintenance. Without knowing how long the construction period is for each reasonably foreseeable development, it is difficult to predict the Project's incremental contribution to increased air emissions. The mitigation measures in Sections 7.2.4 and 7.4.4 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D) will reduce the Project-related cumulative air emissions. It is anticipated that many operators of reasonably foreseeable developments will also implement mitigation measures developed in accordance with industry standards for air emissions. For example, Enbridge is recommending the same mitigation measures to reduce air emissions for the Line 2 Replacement Project (Table 8A.1-1 of Appendix 8.1), the Edmonton Terminal (South) Expansion Project (Table 8A.1-5 of Appendix 8.1) and the Edmonton to Hardisty Pipeline Project (Table 8A.1-1 of Appendix 8.1).

Future developments constructed prior to the Project that will not result in increased emissions during operations (*e.g.*, pipelines, transmission lines, municipal infrastructure, commercial and residential developments) are not likely to contribute to a cumulative increase in air emissions in the Air Quality RSA. The Project may act in combination with reasonably foreseeable developments constructed concurrently to increase dust and smoke, as well as air emissions from vehicle and machinery use in the Air Quality RSA. However, for reasons described more fully below, the Project is unlikely to act in combination with most reasonably foreseeable developments to cause increased air emissions in a particular area and it is unlikely that any exceedances of applicable air quality objectives would occur as a result.

For example, major proposed and identified projects include the Vista Project located approximately 10 km east of Hinton (Figure 8.1-1a) and the Ajax Project located partially within Kamloops city limits along the existing TMEP right of way and approximately 4 km south-southeast of the Kamloops Pump Station (Figure 8.1-1c). The Vista Project is currently undergoing regulatory review of the environmental impact assessment documents filed with AESRD (AESRD 2013, Coalspur 2013). These documents indicate that all of the construction activities related to blasting, brush burning and removal of overburden combined with operations-related emissions will meet all applicable Alberta ambient air quality objectives at all off-site receptors. As such, a combined effect from the Vista Project may create an additive effect when combined with TMEP construction activities if they occurred at the same time, however, exceedances of the ambient objectives are not expected to occur due to the benefit of atmospheric dispersion and separation distance. The second project, the Ajax open pit copper and gold mine, is currently in the pre-application phase and information on air emissions from construction or operations activities has not been made public (Ajax 2013, Province of BC 2013). However, detailed dispersion modelling is currently underway as part of the environmental impact assessment for the project (Ajax 2013). Based on the results of detailed dispersion modelling, it is expected that the proponent will be required to meet all BC ambient air quality objectives and standards by incorporating best management practices and mitigation measures to limit particulate emissions. As indicated in the effects assessment in Section 7.0, particulate emissions related to TMEP will be discharged from combustion of natural gas in heaters and their contribution to the maximum concentrations was very small. Most of the combined predicted TMEP and background particulate matter concentrations come from the ambient background (>99%). Under some circumstances, the Ajax mine may contribute to the measured ambient background particulate matter levels in Kamloops, however, emissions from the TMEP Kamloops Terminal heaters and storage tanks, and fugitive emissions from the Kamloops Pump Station are not expected to materially affect these levels nor exceed ambient air quality objectives in the Kamloops area.

Participants at many of the community workshops (*e.g.*, Hinton, Valemount, Blue River, Kamloops, Merritt, Hope, Chilliwack, Abbotsford and Burnaby) raised concerns over construction-related air emissions from the Project affecting air quality. In most communities, construction activities have the potential to act in combination with existing activities as well as reasonably foreseeable developments such as commercial and residential projects and road upgrades and improvements, which are assumed to have the potential to occur in any community at any time. Trans Mountain will reduce construction-related emissions and minimize air emissions at residential locations through implementation of mitigation measures provided in Section 7.2.4 and the Pipeline EPP (Volume 6B).

Participants at the Kamloops ESA Workshop raised concerns over construction-related air emissions, particularly smoke from burning and dust from blasting from the Project affecting air quality. The BC *Open Burning Smoke Control Regulation* requires a number of conditions to limit effects to residents, including setting minimum distances to residences, avoidance of adverse dispersion conditions and limiting the duration of brush burning (Government of BC 1993).

Another proposed development of note is the Surrey Fraser Docks Direct Transfer Coal Facility, which is located approximately 10 km south of the Burnaby Terminal (Table 8A.1-6 of Appendix 8.1). A detailed air quality assessment of CACs was completed for this project by the proponent and included emissions from ship engines as well as fugitive particulate emissions from coal loading. The predicted results indicated exceedances of the ambient air quality objectives for NO_2 near the freighters over water due to engine exhaust. As well, increases in ambient particulate matter levels were predicted to occur. A site-specific particulate matter management plan was developed to reduce the amount of fugitives from coal handling and loading. This facility is required to meet applicable Metro Vancouver ambient air quality objectives on land. With this plan in place and through the benefit of atmospheric dispersion over the 10 km to the Air Quality RSA, it is expected that emissions from the Surrey Fraser coal facility will not act in combination with the Project, particularly the Westridge Marine and Burnaby terminals, to cause a cumulative increase in existing ambient air quality levels in the Air Quality RSA (*i.e.*, no spatial overlap in emissions from the developments is anticipated that would result in a decrease in air quality). Therefore, a quantitative assessment for the Surrey Fraser facility is not required.

The Project's contribution to cumulative increase in air emissions will be reduced by following mitigation provided in Sections 7.2.4 and 7.4.4 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D). It is expected that many other developments will implement mitigation measures similar to those implemented for the Project that have been developed in accordance with industry and provincial regulatory guidelines to reduce effects to air quality. No mitigation measures beyond the Project-specific mitigation already proposed for air emissions indicators in Section 7.0 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D) are deemed warranted.

The Project's contribution to a cumulative increase in CAC and VOC emissions during construction and operations activities (*e.g.*, vegetation management, routine inspections, site-specific maintenance) within the Air Quality RSA is considered to have a negative impact balance, is reversible in the long-term and of low to medium magnitude depending on distance to receptors, land use (*e.g.*, rural vs. urban), construction techniques (*e.g.*, blasting vs. ripping, mulching vs. burning) and soil conditions (Table 8.4-2, point 1[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on increased CAC and VOC emissions is provided below.

- Spatial Boundary: Air Quality RSA – the Project's contribution to cumulative increases in CAC and VOC emissions from construction and operations activities would dissipate within the Air Quality RSA.
- Duration: short-term – the events causing the Project's contribution to increases in air emissions are construction and operations activities such as routine inspections and site-specific maintenance activities in the LSA.
- Frequency: isolated to periodic – the event causing the Project's contribution to cumulative increases in air emissions (*i.e.*, construction of the pipeline) is confined to a specific period, while operations activities (*e.g.*, vegetation management, routine inspections, site-specific maintenance) will occur intermittently but repeatedly over the assessment period.
- Reversibility: long-term – the Project's contribution to cumulative effects will reverse within several days once construction or inspection and maintenance activities are complete.
- Magnitude: low to medium – the Project's contribution to a cumulative increase in air emissions will vary depending on distance to receptors, land use (*e.g.*, rural vs. urban), construction techniques (*e.g.*, blasting vs. ripping, mulching vs. burning) and soil conditions, while periodic increases in air emissions during routine operations will be within normal variability of existing conditions with the implementation of proposed mitigation measures.
- Probability: high – the equipment and vehicles used will emit air emissions, burning will emit smoke, and ground disturbance will suspend fugitive dust emissions.
- Confidence: moderate – based on the professional experience of the assessment team.

Increased Volatile Organic Compound Concentrations during Storage Tank Operations and Tanker Loading

VOC emissions from storage tanks are fugitive in nature and the magnitude is related to standing losses due to changes in ambient temperature and pressure or working losses due to pumping of the product into or out of the tanks. Losses of VOCs from tanker loading are also fugitive emissions. The potential for a cumulative effect from the Project and interaction with a reasonably foreseeable development was considered. Major proposed projects and available project details were reviewed and evaluated for possible interaction within each Air Quality RSA of the terminals.

At their Edmonton Terminal (South), Enbridge recently received approval (July 26, 2013) from the NEB to construct and operate five new storage tanks as part of the Edmonton Terminal (South) Expansion Project (Table 8A.1-5 of Appendix 8.1). This Enbridge terminal is located approximately 2 km southeast of Trans Mountain's Edmonton Terminal. These storage tanks are expected to receive and store crude oil and have the potential to create fugitive emissions of VOCs in a manner as noted above for the Trans Mountain Edmonton Terminal. An air quality assessment of the proposed upgrade was completed and filed with the NEB (NEB 2013g). The results indicated that the maximum predicted concentrations for all air contaminants were below their applicable Alberta Ambient Air Quality Objectives. Based on a review of the predicted maximum concentration contours for benzene in the vicinity of the Trans Mountain

Edmonton Terminal, the effect of the five new storage tanks is not expected to be distinguishable from current ambient background levels.

In the detailed air quality assessment conducted for the TMEP in Section 7.0, emissions from the existing Enbridge Edmonton Terminal (South) were included in the dispersion model but not these five new tanks. Upon review of the modelling results, VOC emissions from the existing Suncor refinery were found to dominate the maximum predicted VOC concentrations in the Air Quality RSA. Suncor reported 11.5 tonnes for 2011 to the National Pollutant Release Inventory, whereas Enbridge did not report benzene emissions for that year. Based on the reporting threshold of 1 tonnes for benzene, total emissions from the Enbridge Terminal are <10% of those from Suncor. Accordingly, the incremental effects of fugitive emissions from the new tanks are not expected to materially influence the predicted concentration maximum. Therefore, a qualitative assessment was used to determine that no residual effect would be expected and the applicable AESRD ambient air quality objectives would continue to be met. No interaction of VOC emissions at the Sumas, Kamloops, Burnaby and Westridge Marine terminals with reasonably foreseeable projects are expected to occur.

The Project's contribution to a cumulative increase in VOC emissions from storage tanks and tanker loading within the Air Quality RSA during normal operations activities is considered to have a negative impact balance, is reversible over the long-term and of low magnitude (Table 8.4-2, point 1[b]). A summary of the rationale for all of the significance criteria of combined cumulative effects on increased VOC emissions is provided below.

- Spatial Boundary: Air Quality RSA – the Project's contribution to cumulative increases in VOC emissions from storage tanks and during tanker loading would dissipate within the Air Quality RSA.
- Duration: long-term – fugitive emissions of VOCs and subsequent changes to ambient ground-level concentrations are expected to occur for the life of the Project and are, therefore, rated as long-term.
- Frequency: continuous – the Project's contribution to cumulative increases in VOC emissions would be continuous.
- Reversibility: long-term – the Project's contribution to cumulative effects will extend for the life of the operating terminal and will cease when the facility is decommissioned.
- Magnitude: low – the Project's contribution to an increase in VOC emissions is expected to be low.
- Probability: high – Project fugitive emissions will occur on an ongoing basis.
- Confidence: moderate – based on a good understanding of cause-effect relationships between the Project, air emissions, and atmospheric reactions; however, there is uncertainty with respect to existing and future non-Project emissions, and atmospheric chemical reactions are complex.

8.4.3.2 Air Emissions Indicator – Formation of Secondary Particulate Matter and Ozone

There is no detailed inventory information available with respect to major foreseeable developments or urban emissions in the LFV that would permit a future scenario to be modelled for the indicators of secondary particulate matter and ozone. Consequently, a quantitative assessment could not be completed; however, a qualitative assessment of the secondary formation of $PM_{2.5}$ and ozone and visibility was carried forward into the cumulative effects assessment. This assessment was based on professional judgment and relied upon forecast marine emissions, proposed major reasonably foreseeable developments and expected urban growth, all of which is expected to contribute potentially to secondary pollutant formation.

The increase in ambient ground-level concentrations of secondary particulate matter and ozone is considered to have a negative impact balance. The increase in ambient ground-level concentrations of secondary particulate matter and ozone is confined to the photochemical model domain or LFV. Some of the marine emissions will contribute chemical pre-cursors for secondary pollutants periodically when tanker traffic travels through the Marine Air Quality RSA. The change will be continuous in duration and reversible in the long-term, however, the magnitude is expected to be low (Table 8.4-2, point 2[a]). A summary of the rationale for all of the significance criteria is provided below.

- Spatial Boundary: LFV – changes to ambient ground-level concentrations of secondary particulate matter and ozone are expected to occur within the LFV.
- Duration: long-term – emissions of pre-cursors and subsequent changes to ambient ground-level concentrations of secondary particulate matter and ozone are expected to occur for the life of the Project and are, therefore, rated as long-term.
- Frequency: continuous – the Project's contribution to the formation of secondary particulate matter and ozone will occur continuously throughout the operations phase.
- Reversibility: long-term – emissions of pre-cursors will cease and any increases in ambient ground-level concentrations of secondary particulate matter and ozone will reverse shortly after tankers exit the Marine Air Quality RSA; however, Project life is more than 10 years.
- Magnitude: low to medium – the increase in ambient ground-level concentrations of secondary particulate matter and ozone is expected to approach but not exceed regulatory limits.
- Probability: high – an increase in Project-related marine vessel traffic will result in pre-cursor emissions, which will react to form secondary particulate matter and ozone.
- Confidence: moderate – cumulative effects assessment is based on a good understanding of cause-effect relationships between Project pre-cursor emissions and resultant ambient particulate matter and ozone concentrations via atmospheric reactions; however, vessel-specific data are limited.

8.4.3.3 Combined Cumulative Effects on Air Emissions

In the Surrey ESA Workshop, participants noted that Trans Mountain should consider cumulative air quality issues resulting from marine and land activities (cumulative emissions from Project and non Project-related marine transport, loading of tankers at Westridge Marine Terminal, and fugitives from the Burnaby Terminal storage tanks). The results of these combined effects from the marine and terrestrial-based emission sources were modelled and evaluated in terms of local impact from primary emissions and secondary formation of photochemical pollutants (Section 7.5.4.6). Construction related VOC emissions were also considered but are minor compared to the other continuous emission sources noted above and as a result, were not modelled.

The Project will contribute to a combined cumulative increase in air emissions in the Air Quality RSA at terminals where tank emissions have the potential to overlap with CAC and VOC emissions from nearby site-specific maintenance or other routine operations activities. The Project's contribution to a cumulative increase in CAC and VOC emissions during site-specific maintenance activities or other routine operations activities (*e.g.*, vegetation management, routine inspections) and tank operations within the Air Quality RSA and LFV is considered to have a negative impact balance, is reversible in the long-term and of low to medium magnitude (Table 8.4-2, point 3[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on increases in CAC and VOC emissions is provided below.

- Spatial Boundary: Air Quality RSA and LFV – the Project's contribution to combined cumulative increases in CAC and VOC emissions from maintenance activities, routine operations activities (*e.g.*, vegetation management, routine inspections) and tank emissions would dissipate within the Air Quality RSA. In the Lower Mainland, the spatial boundary is the LFV which includes the Air Quality RSA.
- Duration: long term – the events causing the Project's contribution to combined cumulative increases in air emissions are maintenance and operations activities (*e.g.*, vegetation management, routine inspections, site-specific maintenance) in vicinity to the storage tanks.
- Frequency: continuous – the events causing the Project's contribution to cumulative increases in air emissions due to maintenance and operations related activities in the LSA will occur continuously over the assessment period.

- Reversibility: long-term – the Project's contribution to combined cumulative effects is expected to extend over the life of the operating terminals until they are decommissioned.
- Magnitude: low to medium – the Project's contribution to cumulative increases in air emissions from site-specific maintenance and operations activities with ongoing tank emissions will approach but not exceed regulatory limits.
- Probability: high – overlapping emissions of CACs and VOCs is considered likely to occur during maintenance and operations activities (*e.g.*, vegetation management, integrity digs, repairs) in vicinity to the storage tanks.
- Confidence: moderate – based on a good understanding of cause-effect relationships between the Project and air emissions.

8.4.4 Summary

As identified in Table 8.4-2, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on air emissions within the Air Quality RSA will be not significant.

8.5 Acoustic Environment

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to cumulatively affect acoustic environment indicators that were anticipated to have an adverse combined Project-specific residual effect (*i.e.*, sound levels and vibration levels).

Potential contribution to cumulative effects on the sound levels indicator is considered to be possible during construction of all Project components and operation of facilities, including the Westridge Marine Terminal. The Project's contribution to cumulative effects on the vibration indicator within the Acoustic Environment RSA is considered to be possible during pipeline construction. Sound emissions and vibrations that occur during Project activities may combine with sound or vibrations emitted from other existing and reasonably foreseeable developments to affect the acoustic environment.

8.5.1 Reasonably Foreseeable Developments

Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 provide a list of the certain and reasonably foreseeable developments located within the Acoustic Environment RSA considered in the evaluation of cumulative effects on the acoustic environment indicators. Description of these developments is provided in Section 8.1.4, and developments in Tables 8A.1-1 to 8A.1-4 are shown on Figures 8.1-1a, 8.1-1b and 8.1-1c. Reasonably foreseeable developments provided in Table 8A.1-5 (for Alberta) and Table 8A.1-6 (for BC) of Appendix 8.1 with the potential to act in combination with the Project were excluded from mapping since development details (*e.g.*, approval status, location) were either not available or the developments were located within urban municipal boundaries, such as the City of Edmonton and LMDA.

In the Acoustic Environment RSA, there are approximately 18 mapped reasonably foreseeable developments either fully within the Acoustic Environment RSA or, for some transmission lines and pipelines, partially within the Air Quality RSA (Table 8A.1-1 of Appendix 8.1). In addition, there are approximately 162 mapped reasonably foreseeable minor oil and gas developments in Alberta: 46 pipelines; 96 facilities; and 20 wells (Tables 8A.1-2, 8A.1-3 and 8A.1-4 of Appendix 8.1).

8.5.2 Potential Cumulative Effects

The potential and likely combined residual effects associated with the construction and operations of the Project on acoustic environment indicators were identified in Section 7.11.1.6 and are listed in Table 8.5-1 along with existing activities and reasonably foreseeable developments that could act in combination with the Project. Sound emitted by pipeline operations (*e.g.*, from site-specific maintenance, vegetation management, inspection) is considered to be of short-term duration and periodic in frequency. As a result, the potential for these activities to overlap with other developments and cumulatively affect day or night sound levels is considered unlikely so pipeline operational noise is not considered further in this cumulative effects assessment.

TABLE 8.5-1

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON THE ACOUSTIC ENVIRONMENT CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Combined Project effects on sound levels.	RSA	Pipeline Temporary Facilities Pump Stations Tanks Westridge Marine Terminal	Construction to Operation	Project contribution to cumulative increase in sound levels during construction and operation.	• Existing activities including: agriculture and livestock grazing, forestry activities, rural and urban residential and commercial development, transportation and infrastructure development, utility activities, oil and gas exploration and development, and mineral resource exploration and development. • Reasonably foreseeable developments within the Acoustic Environment RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities involving mechanical equipment and tank loading could interact with the above activities.
2. Combined Project effects on vibration levels.	RSA	Pipeline	Construction	Project contribution to cumulative increase in vibration emissions.	• There are no existing activities identified with blast vibration emissions. • Reasonably foreseeable developments within the Acoustic Environment RSA listed in Tables 8A.1-1, 8A.1-5 and 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4 that are anticipated to produce vibration emissions during construction (concurrently with pipeline construction) or during operation. • Blasting associated with pipeline construction.

Note: 1 RSA = Acoustic Environment RSA.

8.5.3 Significance Evaluation of Potential Cumulative Effects

A qualitative approach was selected to determine the Project's contribution to combined effects on the acoustic environment since sound and vibration level data for reasonably foreseeable developments were largely unavailable. The AER and BC OGC guidelines used for the assessment of changes in the acoustic environment apply a cumulative approach to evaluation and compliance determination for sound levels. The guidelines indicate that any reasonably foreseeable development must consider any existing development when evaluating compliance, so any new project must design their development while taking into account all existing sound sources. If existing developments have reached the allowed thresholds, any new development must reduce sound levels to ensure the criteria are met. However, this approach does not consider the potential for additive effects from future projects. Due to a lack of standards or guidelines relating to consideration of reasonably foreseeable developments for the acoustic environment, the evaluation of significance relied on the professional judgment of the assessment team.

Table 8.5-2 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on acoustic environment indicators. The rationale used to evaluate the significance of each of the cumulative effects is provided below.

TABLE 8.5-2

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON THE ACOUSTIC ENVIRONMENT

Potential Cumulative Effects		Impact Balance	Spatial Boundary[1]	Temporal Context			Magnitude	Probability	Confidence	Significance[2]
				Duration	Frequency	Reversibility				
1.	Acoustic Environment Indicator – Sound Levels									
1(a)	Project contribution to cumulative increase in sound levels during construction and operation.	Negative	RSA	Short to long-term	Isolated to continuous	Short to long-term	Low to medium	High	Moderate	Not significant
2.	Acoustic Environment Indicator – Vibration Levels									
2(a)	Project contribution to cumulative increase in vibration emissions.	Negative	RSA	Short-term	Isolated	Short-term	Low to medium	Low	High	Not significant
3.	Project Contribution to Combined Cumulative Effects on the Acoustic Environment									
3(a)	Project contribution to combined cumulative effects on the acoustic environment indicators (1[a] and 2[a]).	Negative	RSA	Long-term	Continuous	Short to long-term	Low to medium	High	Moderate	Not significant

Notes: 1 RSA = Acoustic Environment RSA.

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.5.3.1 Acoustic Environment Indicator – Sound Levels

Existing sources of sound emissions in the Acoustic Environment RSA include natural sound, human activity in rural to urban settings (*e.g.*, residences, retail areas, roads and rail), equipment used in agriculture and forestry activities, oil and gas exploration and development, utility activities, transportation activities (*e.g.*, road construction and maintenance), and mineral exploration and development. The construction of the pipeline, temporary facilities, tanks, pumps stations and, to a lesser extent, pipeline reactivation and maintenance of the pipeline will increase sound levels. The operation of the tanks, pump stations and Westridge Marine Terminal will also increase sound levels. The construction and/or operation of reasonably foreseeable developments (as identified in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1) will also generate sound.

The Project was assessed cumulatively with existing facilities through the use of ambient sound level conditions within the assessment, with the result discussed in Section 7.11.1.6. To determine if the Project will act cumulatively with reasonably foreseeable developments in the Acoustic Environment RSA, the spatial location and level of the sound and vibration emitted from those developments during construction and operation would be required. During construction of the Project, construction schedule overlap from other reasonably foreseeable developments within the spatial range of the Acoustic Environment RSA would be required in order for a potential cumulative effect to exist. Without knowing how long the construction period is for each reasonably foreseeable development or the expected sound levels emitted, it is not possible to quantify the Project's contribution to increased sound levels. The mitigation measures in Sections 7.2.6, 7.4.6, 7.5.6 and 7.6.6, as well as the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D), will reduce the magnitude of Project-related cumulative sound levels. It is anticipated that operators of reasonably foreseeable oil and gas development will follow the AER and BC OGC guidance that limits increases in sound levels. It is also assumed that other, non-regulated developments will also implement mitigation measures for control of sound levels, developed in accordance with industry standards.

Reasonably foreseeable developments constructed prior to the Project that do not result in increased sound levels during operation (*e.g.*, pipelines, transmission lines and municipal infrastructure) are not likely to contribute to a cumulative increase in sound levels in the Acoustic Environment RSA. The Project may act in combination with reasonably foreseeable developments constructed concurrently to increase sound levels. Sound from most large industrial operations involving multiple buildings or mobile equipment will usually diminish to below levels where cumulative effects may occur within 5 km (Drew and South 2009). Shorter distances would apply for smaller activities such as a single building or well head. Notwithstanding uncertainties around construction timing, location and duration relative to the Project, the Project is unlikely to act in combination with the construction of most reasonably foreseeable developments in a particular area.

For example, one major proposed project is the Ajax mine located partially within Kamloops city limits in vicinity to the proposed pipeline corridor and approximately 4 km south-southeast of the Kamloops Pump Station. The Ajax open pit copper and gold mine is in the pre-application phase at present and no predicted sound levels from construction or operational activities have been made public (Ajax 2013). It is expected that the proponent will be required to control noise levels at receptors by incorporating best management practices and mitigation measures to limit sound emitted from Ajax mine. The potential for a combined increase in sound levels is unlikely during pipeline construction, based on the current Project schedule. Cumulative effects during Project operations are possible at receptors that may be in between the Ajax mine and Kamloops Pump Station; however, sound levels from the Kamloops Pump Station are predicted to comply with BC OGC *Noise Control Best Practices Guideline* at 500 m from the facility fence line. The potential for sound levels at farther distances to exceed the guideline due to the addition of the Project and future Ajax mine activities is considered unlikely.

Participants of some of the Community Workshops (*e.g.*, Edmonton, Burnaby) raised concerns over sound levels changing due to Project activity. In most communities, Project construction and pump station/tank operations activities have the potential to act in combination with existing activities as well as reasonably foreseeable developments such as commercial and residential projects and road upgrades and improvements, which are assumed to have the potential to occur in any community at any time. The likelihood that background sound will increase with the increased population density in suburban or urban development is taken into account in the determination of guideline limits provided in the AER and BC OGC guidelines (ERCB 2007, BC OGC 2009). The guideline limits on sound levels allow for the density of development, but expect the oil and gas industry to control sound levels to limit increases.

However, reasonably foreseeable development is expected near the Edmonton Terminal as the terminal is located in the approximate centre of an industrial park that hosts a number of other major and minor oil and gas facilities as well as other industry that is not regulated for noise levels. The types of reasonably foreseeable developments identified for the industrial and urban area surrounding the Edmonton Terminal, as identified in Tables 8A.1-1 to 8A.1-5 of Appendix 8.1, are not considered major industrial development that could result in cumulative effects. No receptors were located in the Acoustic Environment LSA; however, high density residential development is located within the Acoustic Environment RSA. Given that the Anthony Henday expressway and other major arterial roads are also located within the RSA, the acoustic environment can be considered saturated. In this type of acoustic environment, incremental changes such as a few pumps or generators associated with pump stations would not result in measurable changes due to the existing ambient sound levels.

Similarly, with respect to residences near the Burnaby Terminal, the acoustic environment can be considered saturated due to the level of urban development. In this type of acoustic environment, incremental changes such as commercial or other non-regulated industry would not result in measurable changes due to the existing ambient sound levels. Only a major redevelopment could result in cumulative effects with existing sound levels as well as other reasonably foreseeable developments

Although regulation and authorization of marine transportation is not specifically within the jurisdiction of the NEB, the environmental and socio-economic effects of the increased marine traffic is considered by Trans Mountain in accordance with the NEB's direction from their List of Issues for the Project, released on July 29, 2013. At Westridge Marine Terminal, non-Project-related vessel traffic growth in Burrard Inlet could result in additional sound at shoreline residential receptors. However, the cumulative effect is expected to be minimal compared to the assessment results discussed in Section 7.6.6. The assessment of the acoustic environment at Westridge Marine Terminal looked at a worst-case with tugs manoeuvring a tanker to the dock. The addition of one or two vessels passing by during this operation is not expected to change the result due to the dominance of the berthing activity. Additional ships in the inlet were determined to not have a cumulative effect on day or night average sound levels as discussed in Section 4.4 of Volume 8A.

The Project's contribution to a combined increase in sound levels will be reduced by following mitigation provided in Section 7.0 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D). It is expected that many other developments will implement mitigation measures similar to those implemented for the Project that have been developed in accordance with industry and provincial guidelines to control sound levels experienced at sensitive receptors. No mitigation measures beyond the Project-specific mitigation already proposed for sound levels in Section 7.0 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D) are deemed warranted.

The Project's contribution to a cumulative increase in sound levels during construction and operation activities within the Acoustic Environment RSA is similar to the potential for increase compared to the existing acoustic environment, except for the probability and confidence. It is considered to have a negative impact balance, is reversible in the short to long-term and of low to medium magnitude depending on distance to receptors, and extent of sound emitting equipment (Table 8.5-2, point 1[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on increased sound levels is provided below.

- Spatial Boundary: Acoustic Environment RSA – the Project's contribution to cumulative increases in sound levels can result when reasonably foreseeable developments are within 5 km of the Project.
- Duration: short to long-term – the Project's contribution to cumulative increases in sound levels will be short-term during the construction phase, while pump stations, storage tanks and the Westridge Marine Terminal have the potential to contribute to cumulative increases in sound levels during the operations phase.
- Frequency: isolated to continuous – the Project's contribution to a cumulative increase in sound levels is isolated for construction of the Project but will be continuous at pump stations, tanks and the Westridge Marine Terminal during operations.
- Reversibility: short to long-term – the Project's contribution to combined noise levels will cease when at any specific location along the proposed pipeline corridor when construction activities have finished and when equipment or facilities are shut down or decommissioned.
- Magnitude: low to medium – with the implementation of appropriate mitigation measures during construction and at the pump stations, tanks and Westridge Marine Terminal during operations, noise levels at receptors are expected to comply with AER, BC OGC and Health Canada limits at receptors near the facilities.
- Probability: high – cumulative effects on the acoustic environment due to sound levels from both the Project and reasonably foreseeable developments may occur near Edmonton and Kamloops, based on the proximity of residential receptors to Project activities and the types of developments. The potential for cumulative effects to result in a change in magnitude in sound levels due to the combination of activity sound emissions is considered unlikely, but possible.
- Confidence: moderate – based on the professional experience of the assessment team.

8.5.3.2 Acoustic Environment Indicator – Vibration Levels

No existing sources of vibration were identified within the Acoustic Environment RSA. The construction of the pipeline may require blasting, which in turn will increase vibration levels. The construction and/or operations of some reasonably foreseeable developments (as identified in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1) may require blasting and, therefore, cause vibration.

To determine if the Project will act cumulatively with reasonably foreseeable developments in the Acoustic Environment RSA, the spatial location and timing of blasting for reasonably foreseeable developments is required, and this information is not available. Therefore, it is not possible to quantify the Project's contribution to future increased vibration levels. The mitigation measures in Sections 7.2.6 and the Pipeline EPP (Volume 6B) will reduce the Project-related cumulative vibration levels. It is anticipated that operators of reasonably foreseeable developments that employ blasting as a construction method would implement mitigation measures for control of vibration levels developed in accordance with industry standards.

One major proposed project was identified in the Acoustic Environment RSA that is expected to employ blasting on a regular basis. The proposed Ajax mine is located partially within Kamloops city limits in vicinity to the proposed pipeline corridor and approximately 4 km south-southeast of the Kamloops Pump Station. The Ajax open pit copper and gold mine is in the pre-application phase at present and predicted vibration levels from blasting have not been made public (Ajax 2013). It is expected that the proponent will be required to control vibration levels at receptors by incorporating best management practices and mitigation measures. The potential for cumulative vibration levels to occur is unlikely during pipeline construction, based on the current Project construction schedule. As Ajax has not yet submitted an application, mine operations are not expected before completion of pipeline construction in this location.

The Project's contribution to cumulative vibration levels will be reduced by following mitigation provided in Section 7.2.6 and the Pipeline EPP (Volume 6B). It is expected that many other developments will implement mitigation measures similar to those implemented for the Project that have been developed in accordance with industry and provincial guidelines to control sound levels experienced at sensitive receptors. No mitigation measures beyond the Project-specific mitigation already proposed for vibration levels in Section 7.2.6 and the Pipeline EPP (Volume 6B) are deemed warranted.

The Project's contribution to a cumulative increase in vibration levels during pipeline construction within the Acoustic Environment RSA is similar to the potential for increase compared to the existing acoustic environment, except for the probability and confidence. It is considered to have a negative impact balance, is reversible in the short-term and of low to medium magnitude depending on distance to receptors (Table 8.5-2, point 2[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on increased vibration levels is provided below.

- Spatial Boundary: Acoustic Environment RSA – the Project's contribution to cumulative increases in vibration levels have the potential to result when reasonably foreseeable developments are within 5 km of the Project.
- Duration: short-term – the Project's contribution to cumulative increases in vibration levels will be restricted to the pipeline construction phase.
- Frequency: isolated – the Project's contribution to combined vibration levels would occur only during the moment of a blast and would be restricted to the construction phase.
- Reversibility: short-term – the Project's contribution to combined vibration levels are associated with construction blasting which may occur over a period longer than 2 days. All vibration level changes are reversible as the vibration will cease when construction is finished.
- Magnitude: low to medium – with the implementation of appropriate mitigation measures during construction, contribution to cumulative increases to vibration levels are expected to be in compliance with guidelines at all receptors.
- Probability: low – for the single future development where cumulative effects potential exists, the expected schedule for development compared to the Project schedule indicates that the potential for pipeline construction blasting and Ajax mine blasting to occur concurrently is unlikely.
- Confidence: high – based on the professional experience of the assessment team.

8.5.3.3 Combined Cumulative Effects on Acoustic Environment

The evaluation of the combined cumulative effects of the Project on the acoustic environment considers collectively the assessment of the combined effects on the sound levels and vibration level indicators. Overall, the Project has the potential to contribute to increased sound and vibration emissions from existing and reasonably foreseeable developments. Impact balance is therefore considered negative. Through implementation of industry standard recommended mitigation measures during the construction and operations phases of the Project, the potential for combined cumulative effects on the acoustic environment indicators are considered to be of low to medium magnitude (Table 8.5-2, point 3[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects of the Project on the acoustic environment indicators is provided below.

- Spatial Boundary: Acoustic Environment RSA – the combined effects of the Project and future development on the sound and vibration levels can result in increases when future activities are within 5 km of the Project.
- Duration: long-term – the events causing combined effects on acoustic environment indicators will occur during the construction and operations phases.
- Frequency: continuous – the combined effects of the Project on noise and vibration levels is isolated for construction of the Project but will be continuous for noise at pump stations, tanks and Westridge Marine Terminal operations, therefore any cumulative effect during operations would also be continuous.
- Reversibility: short to long-term – the Project's contribution to combined noise and vibration levels will cease when blasting stops or equipment or facilities are shut down or decommissioned.
- Magnitude: low to medium – with the implementation of appropriate mitigation measures during construction and at the pump stations, tanks and Westridge Marine Terminal during operations, noise and vibration levels at receptors are expected to comply with guidelines at receptors near the activities.
- Probability: high – cumulative effects on the acoustic environment due to sound levels from both the Project and reasonably foreseeable developments may occur based on the proximity of residential receptors to Project activities and the types of developments. The potential for cumulative effects to result in a change in magnitude in sound levels due to the combination of activity sound emissions is considered unlikely but possible. The expected schedule for development compared to the Project schedule indicates that the potential for pipeline construction blasting and Ajax mine blasting to affect vibration levels concurrently is unlikely.
- Confidence: moderate – based on the nature of data inputs.

8.5.4 Summary

As identified in Table 8.5-2, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on sound and vibration levels within the Acoustic Environment RSA will be not significant.

8.6 Fish and Fish Habitat

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to contribute to cumulative effects on fish and fish habitat indicators that were anticipated to have an adverse combined Project-specific residual effect (*i.e.*, riparian disturbance, instream disturbance, fish mortality and injury and Alberta and BC indicator species).

8.6.1 Reasonably Foreseeable Developments

Tables 8A.1-1, 8A.1-2, 8A.1-3 and 8A.1-4 of Appendix 8.1 provide a list of the certain and reasonably foreseeable developments located within the Aquatics RSA considered in the evaluation of quantitative cumulative effects on the fish and fish habitat indicators. Description of these developments is provided in Section 8.1.4 and is shown on Figures 8.1-1a, 8.1-1b and 8.1-1c. In the Aquatics RSA, there are approximately 68 mapped reasonably foreseeable developments either fully within the Aquatics RSA or, for some transmission lines and pipelines, partially within the Aquatics RSA (Table 8A.1-1 of Appendix 8.1). In addition, there are approximately 2,387 mapped reasonably foreseeable minor oil and gas developments in Alberta: 502 pipelines; 1,617 facilities; and 268 wells (Tables 8A.1-2, 8A.1-3 and 8A.1-4 of Appendix 8.1).

As indicated in Section 8.1, other reasonably foreseeable developments with the potential to act in combination with the Project were excluded from quantitative evaluations since development details (*e.g.*, approval status and location) were either lacking or the development was located within previously disturbed areas of municipal boundaries, such as the city limits of the City of Edmonton and LMDA. Descriptions of these developments are provided in Section 8.1.4 and Table 8A.1-5 for Alberta and Table 8A.1-6 for BC of Appendix 8.1.

The current level of riparian and instream disturbance due to existing activities within the Aquatics RSA as well as the anticipated disturbance attributed to the Project and reasonably foreseeable developments is provided in Tables 8.6-1 and 8.6-2. A hierarchy table was applied during the cumulative effects assessment quantitative analysis to determine priority of overlapping land use features (*i.e.*, features with greater indirect footprint and assumed effects potential are assigned higher priority). In addition, stream crossing density due to existing activities within the Aquatics RSA as well as the anticipated crossing density attributed to the Project and reasonably foreseeable developments is provided in Table 8.6-3 and shown as crossing points on Figures 8.6-1a, 8.6-1b and 8.6-1c.

8.6.2 Potential Cumulative Effects

The potential and likely combined environmental residual effects associated with the construction and operation of the Project on fish and fish habitat indicators were identified in Section 7.2.7 and are listed in Table 8.6-4 along with the identification of existing activities and reasonably foreseeable developments that could act in combination with the Project.

TABLE 8.6-4

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON FISH AND FISH HABITAT CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Combined effects of the Project on riparian habitat.	RSA	Pipeline Temporary Facilities (access roads) Pump Stations (power lines) Tanks (hydrostatic testing) Pipeline Reactivation (hydrostatic testing)	Construction to Operation	Project contribution to cumulative increase in riparian habitat disturbance.	• Existing activities including: agriculture and livestock grazing, forestry, recreation, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development, and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including clearing, topsoil/root zone material salvaging, grading, trenching, backfilling and reclamation of approaches to water crossings and vehicle crossing installation and removal, and bank reclamation.
2. Combined effects of the Project on instream habitat.	RSA	Pipeline Temporary Facilities (access roads) Pump Stations (power lines) Tanks (hydrostatic testing) Pipeline Reactivation (hydrostatic testing)	Construction to Operation	Project contribution to cumulative increase in instream habitat disturbance.	• Existing activities including: agriculture and livestock grazing, forestry, recreation, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development, and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including clearing, topsoil/root zone material salvaging, grading, trenching, backfilling and reclamation of approaches to water crossings and vehicle crossing installation and removal, and bank reclamation.
3. Combined effects of the Project on fish mortality and injury.	RSA	Pipeline Temporary Facilities (access roads) Pump Stations (power lines) Tanks (hydrostatic testing) Pipeline Reactivation (hydrostatic testing)	Construction to Operation	Project contribution to cumulative effects on fish mortality and injury. Project contribution to cumulative effects associated with blockage of fish movements.	• Existing activities including: agriculture and livestock grazing, forestry, recreation, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development, and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including clearing, topsoil/root zone material salvaging, grading, trenching, backfilling and reclamation of approaches to water crossings and vehicle crossing installation and removal, and bank reclamation.

TABLE 8.6-4 Cont'd

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
4. Combined effects of the Project on indicator species (Alberta: Arctic grayling, Athabasca rainbow trout, bull trout, burbot, northern pike and walleye; and BC: bull trout/Dolly Varden, Chinook salmon, coho salmon, cutthroat trout and rainbow trout/steelhead).	RSA	Pipeline Temporary Facilities (access roads) Pump Stations (power lines) Tanks (hydrostatic testing) Pipeline Reactivation (hydrostatic testing)	Construction to Operation	Project contribution to cumulative effects on Arctic grayling. Project contribution to cumulative effects on Athabasca rainbow trout and bull trout. Project contribution to cumulative effects on burbot. Project contribution to cumulative effects on northern pike and walleye. Project contribution to cumulative effects on bull trout/Dolly Varden. Project contribution to cumulative effects on Chinook salmon, coho salmon and cutthroat trout. Project contribution to cumulative effects on rainbow trout/steelhead.	• Existing activities including: agriculture and livestock grazing, forestry, recreation, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development, and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including clearing, topsoil/root zone material salvaging, grading, trenching, backfilling and reclamation of approaches to water crossings and vehicle crossing installation and removal, and bank reclamation.

Note: 1 RSA = Aquatics RSA.

8.6.3 Significance Evaluation of Potential Cumulative Effects

A quantitative analysis was undertaken to evaluate the significance of the Project's contribution to cumulative effects for the disturbance of riparian habitat and instream habitat indicators as these changes were quantifiable. However, as there are no standards, guidelines, objectives or other established and accepted ecological thresholds to define quantitative rating criteria for fish and fish habitat indicators, significance was assessed qualitatively based on the professional judgment of the assessment team.

Table 8.6-5 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on fish and fish habitat indicators. The rationale used to evaluate the significance of each of the cumulative effects is provided below.

TABLE 8.6-5

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON FISH AND FISH HABITAT

Potential Cumulative Effects		Impact Balance	Spatial Boundary[1]	Temporal Context			Magnitude	Probability	Confidence	Significance[2]
				Duration	Frequency	Reversibility				
1.	Fish and Fish Habitat Indicator – Riparian Habitat									
1(a)	Project contribution to cumulative increase in riparian habitat disturbance.	Negative	RSA	Immediate to short-term	Isolated to occasional	Medium to long-term	Low	High	High	Not significant
2.	Fish and Fish Habitat Indicator – Instream Habitat									
2(a)	Project contribution to cumulative increase in instream habitat disturbance.	Negative	RSA	Immediate to short-term	Isolated to occasional	Medium to long-term	Low	High	High	Not significant
3.	Fish and Fish Habitat Indicator – Fish Mortality and Injury									
3(a)	Project contribution to cumulative effects on fish mortality and injury.	Negative	RSA	Immediate to long-term	Occasional to periodic	Long-term	Low	High	High	Not significant
3(b)	Project contribution to cumulative effects associated with blockage of fish movements.	Negative	RSA	Immediate to short-term	Isolated	Immediate to short-term	Low	Low	High	Not significant
4.	Fish and Fish Habitat – Indicator Species									
4(a)	Project contribution to cumulative effects on Arctic grayling.	Negative	RSA	Immediate to short-term	Isolated to occasional	Medium to long-term	Low	High	High	Not significant
4(b)	Project contribution to cumulative effects on Athabasca rainbow trout and bull trout.	Negative	RSA	Immediate to short-term	Isolated to occasional	Medium to long-term	Low	High	High	Not significant
4(c)	Project contribution to cumulative effects on burbot.	Negative	RSA	Immediate to long-term	Isolated to periodic	Long-term	Low	High	High	Not significant
4(d)	Project contribution to cumulative effects on northern pike and walleye.	Negative	RSA	Immediate to short-term	Isolated to occasional	Medium to long-term	Low	High	High	Not significant
4(e)	Project contribution to cumulative effects on bull trout/Dolly Varden.	Negative	RSA	Immediate to short-term	Isolated to occasional	Medium to long-term	Low	High	High	Not significant
4(f)	Project contribution to cumulative effects on Chinook salmon, coho salmon and cutthroat trout.	Negative	RSA	Immediate to short-term	Isolated to occasional	Medium to long-term	Low	High	High	Not significant
4(g)	Project contribution to cumulative effects on rainbow trout/steelhead.	Negative	RSA	Immediate to long-term	Isolated to periodic	Long-term	Low	High	High	Not significant
5.	Project Contribution to Combined Cumulative Effects on Fish and Fish Habitat									
5(a)	Project contribution to combined cumulative effects on the fish and fish habitat indictors (1[a]-4[g]).	Negative	RSA	Immediate to long-term	Isolated to periodic	Immediate to long-term	Low	High	High	Not significant

Notes: 1 RSA = Aquatics RSA.

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.6.3.1 Fish and Fish Habitat Indicator – Riparian Habitat

Riparian habitat plays an important role in the maintenance of healthy aquatic environments. Riparian vegetation stabilizes streambanks, buffers streams from sedimentation contained in surface runoff, contributes food and nutrients such as insects and organic matter, provides woody debris which contribute to stream diversity, provides shade to help regulate stream temperature, and provides cover that affords safe habitat for smaller fish.

Clearing or disturbance of riparian habitat can affect fish and instream habitat through an increase in sedimentation in the watercourse, decreased bank and approach stability, reductions in stream shading potential and the loss of instream and overhead cover. The degree to which fish can be affected depends upon, among other influences, the total area of disturbed riparian habitat.

The area of riparian habitat disturbance can be used as a quantitative measure of possible bank disturbance, sediment yield and overall watershed health, thereby allowing the Project's contribution to cumulative effects to be estimated (Anderson 1996, Beaudry 1998, CAPP *et al.* 2005, Haas 2001, Hughes *et al.* 2004, Salmo *et al.* 2003, Sawyer and Mayhood 1998, Scrimgeour *et al.* 2003, Sloat *et al.* 2001). Project facilities and activities are located in 8 watersheds within the Athabasca and North Saskatchewan river drainages in Alberta and 13 watersheds within the Fraser, Thompson and Columbia river drainages, and 1 coastal watershed in BC. Watersheds crossed by the Project reflect a broad range of riparian habitat conditions due to past land use activities (Fisheries [Alberta] Technical Report and Fisheries [BC] Technical Report of Volume 5C).

Quantitative analyses were completed for each watershed crossed by the proposed pipeline corridor using readily available data sources as described in Section 8.1.5.1. The potential area of riparian habitat lost or altered was calculated for existing activities, the Project and reasonably foreseeable development activities. Criteria, which are based on channel width, exist for protecting riparian areas from development activities (*e.g.*, riparian management areas in the *Environmental Protection and Management Regulation* of the *Oil and Gas Activities Act* that range from 100 m for large, fish-bearing watercourses to 20 m for small, nonfish-bearing watercourses). For this desktop analysis, it was necessary to assume a standardized riparian width of 30 m for all waterbodies in riparian disturbance calculations because it was not practical to determine the channel width and fish-bearing status of all waterbodies in the Aquatics RSA (AESRD 2012). Disturbance of riparian areas from the Project, existing and reasonably foreseeable development activities, were estimated. Note that riparian disturbance attributed to reasonably foreseeable development is underestimated because spatial data on future harvesting and associated roads was not available.

Existing activities that have disturbed riparian habitat include agriculture (including grazing), rural and urban residential and commercial development, transportation and infrastructure development (*e.g.*, road and rail networks), utility activities, forestry, mineral resource exploration and development, ongoing recreational activities, and oil and gas exploration and development (*e.g.*, seismic cutlines and pipelines). It is anticipated that the Project and reasonably foreseeable developments (as identified in Tables 8A.1-1, 8A.1-2, 8A.1-3 and 8A.1-4 of Appendix 8.1) have the potential to act cumulatively to increase riparian disturbance within the Aquatics RSA in both Alberta and BC. Characterization of the Project's contribution to cumulative effects on riparian disturbance relied on available hazard ratings and the professional judgment of the assessment team. Hazard levels assigned based on the BC Interior Watershed Assessment Procedure (BCFS and BCE 1995) were:

- low hazard: 0-9% disturbed;
- medium hazard: > 9-18% disturbed; and
- high hazard: > 18% disturbed.

Results of riparian disturbance estimates are provided in Tables 8.6-6 and 8.6-7 for each watershed crossed by the proposed pipeline corridor, since potential cumulative effects on fish and fish habitat are most appropriately considered at the watershed scale. From an aquatics perspective, land use features are concentrated in the eastern half of the Alberta Aquatics RSA, (*i.e.*, Sturgeon, Pembina, Upper/Mid/Lower Saskatchewan river watersheds) and in the central portion of the BC Aquatics RSA (*i.e.*, Lower North and South Thompson rivers, the Thompson River and the Lower Nicola River watersheds). Currently, forest harvesting and agriculture are the largest contributors to riparian disturbance in the Aquatics RSA (Table 8.6-1). Alberta TEK participants specifically noted the decrease in water quality and fish populations over the past 30 years in the Edmonton to Hinton region, which they consider to be due to the cumulative effects of pollution and industrial development. As mentioned in Section 8.1.5, larger municipalities, such as the City of Edmonton and the LMDA, were excluded from the quantitative analysis with the exception of the portion of the Golden Ears Connector development through a City of Surrey greenbelt. However, no riparian habitat in the greenbelt is affected by this reasonably foreseeable development or the Project. Effects of the Project on riparian habitat were addressed in Section 7.2.7.

Cumulative effects hazard resulting from riparian disturbance is currently:

- low in the Upper Fraser River, Canoe Reach and Clearwater River watersheds (*i.e.*, 1.50-3.65%);

- moderate in the Upper North Thompson River, Fraser Canyon, Harrison River, Chilliwack River, and Upper McLeod River watersheds (*i.e.*, 11.79-14.89%); and
- high in all remaining watersheds, ranging from 19.03-75.63%.

Existing disturbance of riparian areas is highest in the Lower North Saskatchewan River watershed and is due primarily to agriculture. Cumulative effects hazard is projected to increase incrementally in all watersheds as a result of reasonably foreseeable developments and the Project (*i.e.*, 0.49% increase for Alberta and 0.19% for BC), and is projected to remain the highest in the Lower North Saskatchewan River watershed. The largest incremental increase is projected to occur in the Upper McLeod River watershed and is due primarily to reasonably foreseeable developments (*i.e.*, proposed coal mine developments). The incremental increase in riparian disturbance does not affect the hazard rating in any of the assessed watersheds.

The Project may contribute < 0.01- 0.15%, or an average of 0.05%, to total riparian habitat disturbance in the Aquatics RSA. The mitigation measures outlined in Section 7.2.7.4 (*e.g.*, seeding disturbed riparian areas with the appropriate native seed mix, along with a quick establishing cover crop and additional revegetation efforts, such as planting trees or shrubs at select locations), will limit the Project's contribution to cumulative effects. In addition, it is expected that many other land users will implement riparian habitat protection measures to reduce incremental effects of their activities, as recommended in federal and provincial guidelines and best management practices discussed in Section 7.1.1.2 of the Fisheries (BC) Technical Report, Section 7.1.2 of the Fisheries (Alberta) Technical Report and in activity-specific guidance documents for grazing, back-country tourism and off-roading (BC MFLNRO 2011, BC MFR 2008, BC MOE 2006, Fraser 2009). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed to be warranted.

TABLE 8.6-6

Notes:

1. The Lower Fraser River and Squamish watersheds are not included because Project riparian disturbance in these watersheds is located within the LMDA, and the LMDA has been excluded from the quantitative analysis (Section 8.1.5).
2. Calculations based on an average of 30 m riparian area on each bank at all waterbodies.
3. Calculations based on footprint disturbances provided in Table 8.1-1 and are approximate.

Given that the Project is adjacent to existing linear disturbances and clearings, where practical, and the Project's contribution is 0.05% of combined riparian disturbance, the Project's contribution to total watershed riparian disturbance is of low magnitude. The cumulative effect of clearing riparian vegetation is considered to be reversible in the medium to long-term, depending on the pre-existing vegetation community (*e.g.*, grasses and shrubs regenerate within several years, but tree canopy regrowth is expected to extend into the long-term) (Table 8.6-5, point 1[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on riparian habitat is provided below.

- Spatial Boundary: Aquatics RSA – Project pipeline disturbance will be confined to the Fish and Fish Habitat LSA, but watershed-scale effects from overlapping disturbance could extend to the RSA.
- Duration: immediate to short-term – Project activities causing disturbance of riparian vegetation occurs during the construction phase or maintenance during the operations phase (lasting 2 days to less than 1 year).
- Frequency: isolated to occasional – the Project's contribution to cumulative changes in riparian habitat occurs during construction and then intermittently, but sporadically, over the assessment period during maintenance activities.
- Reversibility: medium to long-term – depending upon the pre-construction vegetation community (*e.g.*, grasses and shrubs regenerate within several years, however, tree canopy regrowth is expected to extend into the long-term) and the extent of clearing or alteration of riparian vegetation required for maintenance activities.
- Magnitude: low – the Project's incremental contribution represents 0.05% of the combined riparian disturbance; for comparison purposes a change in the hazard index of 0.1 is equivalent to a 3% increase in riparian disturbance as per the BC Interior Watershed Assessment Procedure. The Project will implement federal and provincial guidance recommendations and the proposed pipeline corridor will follow existing linear disturbances for approximately 89% of its length to reduce watershed-scale riparian disturbance.
- Probability: high – clearing or disturbance of riparian vegetation is expected to occur at all trenched watercourse crossings and any existing activities and/or reasonably foreseeable developments within the Aquatics RSA occurring in proximity to watercourses, having the potential to cause changes in riparian habitat.
- Confidence: high – based on available research literature and the professional experience of the assessment team.

8.6.3.2 Fish and Fish Habitat Indicator – Instream Habitat

Fish need spawning, incubation, rearing, adult feeding and overwintering habitats over their lifetime. The importance of these habitats varies between species and populations and the availability of one or more components may be limiting. Migrant populations must pass through several distinct habitats while moving between feeding, breeding and overwintering areas; these migration corridors are also important habitat features (Meehan 1991).

Direct habitat loss occurs where the bed or banks of waterbodies are disturbed and recovery to preconstruction conditions does not occur. This reduces the quantity of habitat for specific species and life history stages. In extreme cases like stream diversions and channel dewatering, habitat for all aquatic species may be lost. Urban or agricultural development on lakeshores such as dykes, docks, marinas and vegetation removal can alter the physical structure of inshore habitats, rendering them unsuitable for spawning or rearing (Ford *et al.* 1995).

Habitat alteration occurs where waterbodies are disturbed and habitat attributes such as substrate and depth are deliberately or inadvertently changed. In cases where recovery of existing habitat units is allowed or encouraged, the effect of habitat alteration will occur only until the pre-construction conditions are re-established at watercourse crossings. Long-term or permanent habitat alteration can occur where recovery or restoration of different habitat units is accepted (*e.g.*, converting shallow riffle areas to deeper pools). Habitat may also be altered by the introduction of non-native or exotic vegetation that modifies substrate, banks or trophic relationships. Grazing where cattle have direct access to stream channels can disturb instream substrates, negatively impact streambank structure, and result in deposition of manure and urine in the stream.

Changes in water quality and temperature may occur downstream of industrial and municipal stormwater and cooling pond discharges. Indirect introduction of chemical contaminants may also occur where compounds are adsorbed to sediment, deposited from the atmosphere, or released during accidents and malfunctions. Finally, water level control structures, water withdrawals and direct or indirect changes in seasonal flow patterns and peak and minimum flows (*e.g.*, from forest clearing, road networks and hydrostatic testing) can alter instream habitat.

Construction and maintenance of road, transportation, and utility watercourse crossings and other clearing or disturbance of riparian habitat can alter the physical characteristics of a watercourse's bed and banks, result in short-term or chronic erosion that affects water quality and substrate composition, and cause inadvertent inflow of road salt and contaminants from accidental spills. The continued use of these rights-of-way for stream access can exacerbate this concern. The influence of these combined changes on instream habitat depends upon several factors, including: natural variability in channel structure and water quality; season, the volume and extent of contamination or sedimentation; and the type of habitat lost or altered and its use by each species and life cycle stage.

The combined area of instream habitat disturbance was used as a measure of the potential direct disturbance within a stream channel, thereby allowing the Project's contribution to cumulative effects to be estimated. Quantitative analyses were completed for each watershed crossed by the proposed pipeline corridor using readily available data sources as described in Section 8.1.5.1. The area of instream habitat potentially lost or altered by existing activities, the Project, and linear reasonably foreseeable developments were calculated (linear features as identified in Tables 8A.1-1 and 8A.1-2 of Appendix 8.1). GIS hydrology data available for Alberta and BC only provides an indication of channel width for major rivers (*i.e.*, Freshwater Atlas [FWA] of BC river dataset and Base Features hydrology dataset for Alberta). Consequently, Project-specific watercourse crossing data were used to calculate an average channel width on a provincial basis for all streams not included in the major river datasets. Assumptions in the calculation of instream disturbance include:

- it was assumed that instream disturbance would occur at only 50% of mapped crossings, recognizing that only a limited number of existing crossings may continue to contribute to instream disturbance (Harper and Quigley 2000); and
- crossings by transmission lines and cutlines were assumed to not contribute to instream disturbance.

Existing activities that have potentially resulted in disturbed instream habitat include agriculture, rural and urban residential and commercial development, transportation and infrastructure development (*e.g.*, road and rail networks), utility activities, forestry, mineral resource exploration and development, ongoing recreational use of linear features, and oil and gas pipelines. It is expected that the Project and reasonably foreseeable developments (as identified in Tables 8A.1-1 and 8A.1-2 of Appendix 8.1) will have the potential to act cumulatively to increase instream disturbance within the Aquatics RSA. Note that instream disturbance attributed to reasonably foreseeable development is underestimated because spatial data on future harvesting and associated roads was not available.

As mentioned in Section 8.1.5, larger municipalities, such as the City of Edmonton and the LMDA, were excluded from the quantitative analysis with the exception of the portion of the Golden Ears Connector development through a City of Surrey greenbelt. However, no instream habitat in the greenbelt is affected by this reasonably foreseeable development or the Project. Effects of the Project on instream habitat were addressed in Section 7.2.7.

Instream disturbance estimates for existing activities, the Project, and reasonably foreseeable developments are provided in Tables 8.6-8 and 8.6-9, for each watershed crossed by the Project. If practical, approximately 22 watercourses along the proposed pipeline corridor will be crossed using a trenchless crossing technique. Therefore, Tables 8.6-8 and 8.6-9 provide the following two estimates of instream disturbance arising from construction of the Project: assuming all proposed trenchless crossings are implemented, and assuming none of the proposed trenchless crossings are implemented.

TABLE 8.6-8

ESTIMATED DISTURBANCES OF INSTREAM AREA WITHIN THE ALBERTA AQUATICS RSA

Notes:

1. The Lower Fraser River and Squamish watersheds are not included because Project instream disturbance in these watersheds is located within the LMDA, and the LMDA has been excluded from the quantitative analysis (Section 8.1.5).

   The Similkameen watershed is not included because there is no Project instream disturbance in this watershed.

2. Calculations based on footprint disturbances provided in Table 8.1-1 and are approximate.

Potential instream disturbance currently ranges from 0.09-1.06 % with the highest proportion in the Lower North Saskatchewan River watershed, as was the case for riparian disturbance. The Project (assuming no trenchless crossings) and reasonably foreseeable developments would increase instream disturbance incrementally in all watersheds (*i.e.*, increase of 0.04% in Alberta and 0.02% in BC), with greatest total disturbance predicted to remain highest in the Lower North Saskatchewan watershed. The Project's overall contribution to combined instream habitat disturbance would be < 0.01% in Alberta and 0.02% in BC; the Project's contribution to instream disturbance is projected to be highest in the Upper North Thompson and Lower Nicola river watersheds at 0.05%. The Project's effect on instream disturbance would be reduced if all proposed trenchless crossings are constructed, particularly in BC, to approximately 0.01% of available habitat.

Trenched pipeline crossings, the installation, use and removal of temporary vehicle crossings, and hydrostatic testing associated with the Project will likely result in a temporary disruption of instream habitat function; however, some existing and reasonably foreseeable developments can be expected to cause long-term, continuous effects on water quality and flow characteristics. The Project's contribution to changes in instream habitat function will be reduced through the use of trenchless crossings where practical, and the implementation of industry-standard mitigation measures provided in Section 7.0 and the Pipeline EPP (Volume 6B), which have been recommended by industry as well as provincial and federal agencies (*e.g.*, CAPP *et al.* 2005) as effective measures to reduce the loss and alteration of instream habitat. A fish habitat compensation/offset plan may be developed to ensure serious harm to fish or any permanent alteration to, or destruction of, fish habitat does not result. Water quality monitoring will be conducted to document potential sediment loading from instream activities where sensitive fish habitat is present. In addition, it is anticipated that many other land users will implement mitigation measures prescribed by legislation or identified in federal and provincial guidance documents to reduce incremental effects of their activities (refer to Section 8.6.3.1 above). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6D) are deemed to be warranted to reduce the potential for cumulative effects on instream disturbance.

Given that the Project's contribution to combined instream disturbance is 0.01%, federal and provincial guidance recommendations will be implemented, and trenchless crossings constructed where practical, the Project's contribution to total watershed instream loss is concluded to be of low magnitude. The Project's contribution to cumulative effects on instream habitat loss and alteration is considered to be reversible in the medium to long-term, depending on the pre-existing channel structure, channel composition, seasonal flow characteristics and potential continued off-highway vehicle activity (Table 8.6-5, point 2[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on instream habitat is provided below.

- Spatial Boundary: Aquatics RSA – Project pipeline disturbance will be confined to the Fish and Fish Habitat LSA, but watershed-scale effects from overlapping disturbance could extend to the RSA.
- Duration: immediate to short-term – Project activities contributing to disturbance of instream habitat occur during the construction phase or maintenance during the operations phase (lasting 2 days to less than 1 year).
- Frequency: isolated to occasional – the Project events contributing to the cumulative changes to instream habitat occur during construction and then intermittently, but sporadically, over the assessment period during maintenance activities.
- Reversibility: medium to long-term – depending upon the pre-construction channel characteristics and future flow regime, and potential continued stream access by off-highway vehicles.
- Magnitude: low – in addition to the construction of trenchless crossings where practical, alignment along existing rights-of-way where possible, the Project will implement federal and provincial guidance recommendations (*e.g.*, timing window requirements, restoration of channel profile, bank stabilization measures, tree and shrub plantings to prevent access) and, consequently, will not substantially contribute to total instream disturbances in the Aquatics RSA.

- Probability: high – bank and instream activities at all trenched watercourse crossings and any existing activities and/or reasonably foreseeable developments within the Aquatics RSA occurring in proximity to watercourses have the potential to cause changes in instream habitat.
- Confidence: high – based on available research literature and the professional experience of the assessment team.

8.6.3.3 Fish and Fish Habitat Indicator – Fish Mortality and Injury

Combined Effects on Fish Mortality and Injury Due to Sedimentation and Access

Fish population dynamics reflect the combined influence of physical, chemical and biotic factors and harvest on growth, survival and reproduction. As a result, observed population size and parameters vary greatly among populations and years (Hayes *et al.* 1996, Kocovsky and Carline 2001, Mosindy *et al.* 1987). Human sources of fish mortality and injury in the Aquatics RSA include commercial, recreational, and subsistence harvest, water withdrawals, sedimentation (due to instream construction and off-road vehicle fordings), and acute and chronic effects from approved or accidental discharge of contaminants.

The construction of new rights-of-way (*e.g.*, pipeline or transmission line) can result in increased access along the resulting corridors for a variety of other resource user groups (*e.g.*, off-highway vehicles, anglers). In turn, this can potentially result in negative effects on fishes and their habitat either through direct harvesting or indirect effects such as fish habitat degradation and sediment input resulting from vehicle fording. The introduction of fine sediment to watercourses, right-of-way runoff and erosion can have sub-lethal (*e.g.*, irritation of gill tissues) and lethal (*e.g.*, suffocation of developing embryos) effects on fish and can also cause downstream sediment deposition that alters substrate composition and modifies the availability and suitability of habitat (Anderson *et al.* 1996, Newcombe and MacDonald 1991).

Species of special concern or sensitive watersheds and fish populations are at a greater risk of over exploitation. Increased access may contribute to angler overharvest, which has been reported as one of the primary sources of fisheries declines in western Canada (Post and Johnston 2002). Restrictive harvest regulations are implemented in BC to protect sensitive species and reduce the potential for overharvest by anglers (BC MFLNRO 2011b). Stream crossing density was used as a quantifiable measure of erosion, habitat loss, and access hazard for aquatic ecosystems; thereby, allowing the Project's contribution to cumulative effects on fish injury and mortality to be estimated. Quantitative analyses were completed for each watershed crossed by the proposed pipeline corridor using readily available data sources as described in Section 8.1.5.1. Stream crossing density due to existing activities, the Project and reasonably foreseeable developments were calculated.

Stream crossings in the RSA resulting from existing activities include railways, transmission lines, oil and gas features (*e.g.*, cutlines, pipelines), and primary, secondary, and tertiary roads. It is expected that the Project and reasonably foreseeable linear developments (as identified in Tables 8A.1-1 and 8A.1-2 of Appendix 8.1) will have the potential to act cumulatively to increase the stream crossing density within the Aquatics RSA.

As mentioned in Section 8.1.5, larger municipalities, such as the City of Edmonton and the LMDA, were excluded from the quantitative analysis with the exception of the portion of the Golden Ears Connector development through a City of Surrey greenbelt. However, no streams in the greenbelt are affected by this reasonably foreseeable development or the Project. Effects of the Project on fish mortality and injury were addressed in Section 7.2.7.

Results of the stream crossing density estimates are provided in Table 8.6.10 and 8.6.11 for each watershed crossed by the Project.

TABLE 8.6-10

ESTIMATED EXISTING AND FUTURE STREAM CROSSING DENSITY WITHIN THE ALBERTA AQUATICS RSA

Disturbance Assessment Scenario	Stream Crossing Density for Each Watershed[1] in Alberta Aquatics RSA (No. Crossings/km² WS)						
	Sturgeon River	Upper N. Saskatchewan River	Pembina River	Upper McLeod River	Lower McLeod River	Athabasca River	Alberta Aquatics RSA
Existing Disturbance							
Existing Stream Crossing Density	1.34	2.11	1.52	1.76	2.07	2.66	1.85
Future Disturbance							
Stream Crossing Density Attributed to the Project (Project)	< 0.01	< 0.01	< 0.01	< 0.01	< 0.01	0.02	< 0.01
Stream Crossing Density Attributed to Reasonably Foreseeable Developments (Likely Future)	< 0.01	0.01	0.01	0.01	< 0.01	0.01	0.01
Cumulative Effects							
Total Cumulative Stream Crossing Density (Existing+Project+Likely Future)	1.35	2.12	1.54	1.77	2.08	2.69	1.87
Total Cumulative Stream Crossing Density without Project (Existing+Likely Future)	1.35	2.12	1.53	1.77	2.08	2.67	1.86
Total Cumulative Stream Crossing Density Without Reasonably Foreseeable Development (Existing+Project)	1.35	2.11	1.53	1.76	2.07	2.68	1.86

Notes: 1 The Middle North Saskatchewan River watershed is not included because Project disturbance in this watershed is located within the city of Edmonton, and the city of Edmonton has been excluded from the quantitative analysis (Section 8.1.5).

The Lower North Saskatchewan River watershed is not included because there are no new stream crossing locations as a result of the Project in this watershed.

TABLE 8.6-11

ESTIMATED EXISTING AND FUTURE STREAM CROSSING DENSITY WITHIN THE BC AQUATICS RSA

Disturbance Assessment Scenario	Stream Crossing Density for each Watershed[1] in the BC Aquatics RSA (No. Crossings / km² WS)												
	Upper Fraser River	Canoe Reach	Upper North Thompson River	Clearwater River	Lower North Thompson River	Thompson River	South Thompson River	Lower Nicola River	Similkameen	Fraser Canyon	Harrison River	Chilliwack River	BC Aquatics RSA
Existing Disturbance													
Existing Stream Crossing Density	0.40	0.32	1.00	0.38	1.97	2.23	2.38	1.95	1.45	1.53	1.68	1.78	1.35
Future Disturbance													
Stream Crossing Density Attributed to the Project (Project)	0.01	0.01	0.05	< 0.01	0.02	< 0.01	0.01	0.05	0.01	0.01	0.02	< 0.01	0.02
Stream Crossing Density Attributed to Reasonably Foreseeable Developments (Likely Future)	0.03	0	0	0	0	< 0.01	0	0.04	0.02	0.06	0.07	0.07	0.02
Cumulative Effects													
Total Cumulative Stream Crossing Density (Existing+Project+Likely Future)	0.44	0.33	1.05	0.38	1.99	2.24	2.39	2.04	1.48	1.60	1.77	1.86	1.39
Total Cumulative Stream Crossing Density without Project (Existing+Likely Future)	0.44	0.32	1.00	0.38	1.97	2.24	2.38	1.99	1.47	1.59	1.75	1.85	1.37
Total Cumulative Stream Crossing Density Without Reasonably Foreseeable Development (Existing+Project)	0.41	0.33	1.05	0.38	1.99	2.24	2.39	2.00	1.46	1.54	1.70	1.79	1.37

Notes: 1 The Lower Fraser River and Squamish watersheds are not included because Project disturbance in these watersheds is located within the LMDA, and the LMDA has been excluded from the quantitative analysis (Section 8.1.5).

Estimated fish mortality hazard, as measured using stream crossing density, currently ranges from 0.32 crossings/km^2 in the Canoe Reach watershed to 2.66 crossings/km^2 in the Athabasca River watershed, with an overall average of 1.54 crossings/km^2. Tertiary roads and cutlines account for more than 50% of the existing stream crossing density (Table 8.6-3). The Project and reasonably foreseeable developments would incrementally increase the stream crossing density in all watersheds (*i.e.*, an increase of 0.01 crossings/km^2 in Alberta and 0.04 crossings/km^2 in BC), with combined values predicted to remain the highest in Athabasca watershed. In the BC Aquatics RSA, the Project and reasonably foreseeable developments contribute equally to this increase, whereas in Alberta, reasonably foreseeable developments have a greater effect. The Project contributes 0.01 crossings/km^2 to the combined stream crossing density in the watersheds in the Aquatic RSA. The mitigation measures outlined in Table 7.2.7.4 and provided in the Pipeline and Facilities EPPs (Volume 6B and 6C), including limiting the release of suspended sediment during instream activities and implementing access control measures on the pipeline right-of-way, will limit the potential cumulative effects arising from the Project. The alignment of the proposed pipeline corridor along existing rights-of-way as much as practical (*i.e.*, 89% of the total length) further limits the Project's contribution to increased access.

It is expected that many other land users will implement similar measures recommended in federal and provincial guidelines and best management practice documents identified in earlier sections. No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volume 6B and 6C) are deemed warranted (Table 7.2.7.4) to address the potential cumulative effects of fish injury and mortality.

The Project will apply mitigation to reduce construction-related effects, and will be located adjacent to existing linear disturbances and clearings where practical, which will create minimal new access for recreational fishermen and harvesters. For these reasons, the Project's contribution to total fish mortality and injury within the Aquatics RSA is of low magnitude. The Project's contribution to cumulative effects on fish mortality and injury is considered to be reversible in the long-term since harvester access will potentially continue along the right-of-way throughout operations (Table 8.6-5, point 3[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on fish mortality and injury due to sedimentation and access is provided below.

- Spatial Boundary: Aquatics RSA – Project disturbance will be confined to the Fish and Fish Habitat LSA, but watershed-scale effects from overlapping disturbance could extend to the RSA.
- Duration: immediate to long-term – Project activities affecting fish mortality occur during construction (trench dewatering and sedimentation) and operations (access).
- Frequency: occasional to periodic – Project-related access changes to the combined effects on fish mortality occur intermittently and sporadically to repeatedly over the assessment period, depending on waterbody location and species present.
- Reversibility: long-term – harvester access will potentially continue throughout operations.
- Magnitude: low – the Project will be located adjacent to existing linear disturbances and clearings where practical which will create minimal new access for recreational fishermen and harvesters.
- Probability: high – it is likely that cumulative effects on fish mortality and injury will occur at the watershed scale.
- Confidence: high – based on available research literature and the professional experience of the assessment team.

Combined Effects Associated with Temporary Blockage of Fish Movements

Fish populations, particularly migrant populations, may pass through a number of distinct habitats while moving between feeding, breeding and overwintering areas. Consequently, migration corridors can be important habitat features (Meehan 1991).

Complete or partial blockage of fish movements has been documented for rail and road watercourse crossings (*e.g.*, 10-47% of culvert installations depending on the species; Burford *et al.* 2009, MacPherson *et al.* 2012, Park *et al.* 2008). Temporary localized blockage of fish movements may occur during instream construction and affect the ability of fish to migrate upstream or downstream of crossings. Delays in the ability of fish to migrate can affect spawning migrations, increase likelihood of stress or injury, increase competition for food, and limit spatial separation between competing species (Lang *et al.* 2004). The timing (*i.e.*, an appropriate timing window and short duration) of the temporary stream blockage can limit the nature/extent of these potential effects.

Stream crossings contributing to this effect include existing and reasonably foreseeable road, rail and pipeline developments, the Project and those existing culverts that represent complete or partial movement barriers. Figures 8.6-1a, 8.6-1b and 8.6-1c show the Project, reasonably foreseeable development stream crossings and existing crossing locations.

As mentioned in Section 8.1.5, larger municipalities, such as the City of Edmonton and the LMDA, were excluded from the quantitative analysis with the exception of the portion of the Golden Ears Connector development through a City of Surrey greenbelt. However, no streams in the greenbelt are affected by this reasonably foreseeable development or the Project. Effects of the Project on fish mortality and injury were addressed in Section 7.2.7.

Given the short duration of a blockage event associated with a stream crossing, (*e.g.*, less than 2 days), the likelihood of overlap between such events (*i.e.*, between the Project and a reasonably foreseeable activity) within a watershed is limited. The Project's activities, including potential fish blockage at temporary vehicle crossings along temporary access and power lines, can also act cumulatively with existing crossings in the blockage of fish movement; however, the Project's contribution to fish passage barriers will be reduced by the mitigation measures outlined in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C). In addition, it is expected that many other land users will implement similar measures, as recommended in federal and provincial guidelines and best management practice documents (refer to Section 8.6.3.1 above). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volume 6B and 6C) are deemed warranted.

The Project will apply mitigation to reduce construction-related effects, which include following least risk timing window recommendations and limiting the duration of fish blockage; consequently the Project's contribution to potential cumulative effects associated with blockage of fish movement within the Aquatics RSA is considered to be of low magnitude and reversible in the immediate to short-term (*i.e.*, once construction is completed) (Table 8.6-5, point 3[b]). A summary of the rationale for all of the significance criteria of combined cumulative effects on fish blockage is provided is provided below.

- Spatial Boundary: Aquatics RSA – Project disturbance will be confined to the Fish and Fish Habitat LSA, but watershed-scale effects from overlapping disturbance could extend to the RSA.
- Duration: immediate to short-term – Project activities contributing to the potential cumulative effect occur during the construction phase (*i.e.*, instream pipeline construction and temporary vehicle crossings).
- Frequency: isolated – Project-related changes to the combined effects on fish movement occur during construction.
- Reversibility: immediate to short-term – once Project construction is complete; the temporary blockage will be removed (*i.e.*, immediate), and any blockage due to temporary vehicle crossings would be removed (*i.e.*, short-term).
- Magnitude: low – the Project's contribution to cumulative effects is expected to be low, because federal and provincial guidance recommendations will be implemented and permanent habitat loss will not occur.
- Probability: low – the potential for the Project's instream construction to act in a cumulative manner with other reasonably foreseeable developments is low.

- Confidence: high – based on available research literature and the professional experience of the assessment team.

8.6.3.4 Fish and Fish Habitat Indicator – Indicator Species

Indicator species were identified for Alberta and BC which would reflect the regional differences in fish community composition, species abundance, and species of recreational, commercial and cultural importance, that could reasonably be encountered within watercourses in the Aquatics RSA. Six indicator species were selected for Alberta (*i.e.*, Arctic grayling, Athabasca rainbow trout, bull trout, burbot, northern pike and walleye), and five for BC (*i.e.*, bull trout/Dolly Varden, Chinook salmon, coho salmon, cutthroat trout and rainbow trout/steelhead). A brief description of these species and their habitat requirements is provided in Section 5.7 as well as in Section 4.3 of the Fisheries (Alberta) Technical Report and Section 4.3 of the Fisheries (BC) Technical Report (Volume 5C). Distribution of indicator species within the Aquatics RSA is provided in Section 5.7. Section 7.2.7.6 provides a general discussion on the indicator selection process, distribution, status and potential effects for each species.

The watershed disturbance measures (*i.e.*, riparian disturbance, instream disturbance and stream crossings) as discussed in previous sections, were considered in the evaluation of potential cumulative effects on each indicator species allowing the Project's contribution to this potential cumulative effect to be estimated. Combined disturbance that has occurred due to existing activities within the Aquatic RSA as well as the expected disturbance attributed to the construction of the Project and reasonably foreseeable developments were identified by watershed in Tables 8.6-6 to 8.6-11 in the previous sections.

<u>Arctic Grayling (Alberta Indicator Species)</u>

As Section 7.2.7.6 indicates, some potential effects to Arctic grayling are likely (*e.g.*, alteration of riparian and instream habitat) while others are less likely to occur (*e.g.*, injury or mortality of Arctic grayling as a result of increased sedimentation). The distribution of Arctic grayling includes the Pembina, Lower McLeod and Upper McLeod river watersheds.

Cumulative effects hazard resulting from riparian disturbance is currently High in the Pembina and Lower McLeod river watersheds and Moderate in the Upper McLeod River watershed, ranging from 11.97-45.06%; a similar trend is apparent with instream disturbance. The Project and reasonably foreseeable developments would increase riparian disturbance incrementally in the three watersheds (*i.e.*, from 0.06-1.32%); this increase is largely due to reasonably foreseeable development. Project specific riparian disturbance ranges from 0.01-0.05% and is projected to be highest in the Pembina watershed.

The Project (assuming no trenchless crossings) and reasonably foreseeable developments would increase instream disturbance incrementally by < 0.01-0.08%. The projected Project-specific contribution ranges from < 0.01-0.01% and would be further reduced by the implementation of trenchless crossings in the Pembina and Lower McLeod watersheds.

The Project's contribution to the potential cumulative effects on Arctic grayling will be reduced through the implementation of mitigation measures recommended in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C). In addition, it is expected that many other land users will implement similar measures, as recommended in federal and provincial guidelines and best management practices (refer to Section 8.6.3.1 above). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed warranted to address the potential cumulative effects on indicator species.

Given the comparatively small increase in riparian and instream disturbance due to the Project as noted above, the alignment along existing rights-of-way where practical, and the implementation of mitigation to reduce construction and operation-related effects, including proposed trenchless crossings, the Project's contribution to potential cumulative effects associated with Arctic grayling within the Aquatics RSA is of low magnitude. The cumulative effect of disturbance is considered to be reversible in the medium to long-term, depending upon the pre-construction channel characteristics and pre-construction riparian vegetation community (Table 8.6-5, point 4[a]). A summary of the rationale for all of the significance criteria of the combined cumulative effects of the Project on Arctic grayling is provided below.

- Spatial Boundary: Aquatics RSA – Project pipeline disturbance will be confined to the Fish and Fish Habitat LSA, but watershed-scale effects from overlapping disturbance could extend to the RSA.
- Duration: immediate to short-term – Project activities affecting Arctic grayling occur during the construction phase or maintenance during the operations phase (and lasting 2 days to less than 1 year).
- Frequency: isolated to occasional – the Project events contributing to the cumulative changes to instream and riparian habitat occur during construction and then intermittently, but sporadically, over the assessment period during maintenance activities.
- Reversibility: medium to long-term – depending upon the pre-construction channel characteristics and pre-construction riparian vegetation community, and the extent of clearing or alteration of riparian vegetation required for maintenance activities.
- Magnitude: low – in addition to the construction of trenchless crossings where practical, the Project will implement federal and provincial guidance recommendations (*e.g.*, timing window requirements, restoration of channel profile, bank stabilization measures, tree and shrub plantings to prevent access) and, consequently, the Project's contribution to cumulative effects on Arctic grayling is expected to be low.
- Probability: high – it is likely that cumulative effects on Arctic grayling will occur.
- Confidence: high – based on available research literature and the professional experience of the assessment team.

Athabasca Rainbow Trout and Bull Trout (Alberta Indicator Species)

In the indicator species discussions in Section 7.2.7.6, the loss or alteration of instream habitat is identified as the greatest contributor to combined effects for both Athabasca rainbow trout and bull trout. These species are present primarily in the western half of the Alberta RSA, namely the Lower McLeod, Upper McLeod and Athabasca river watersheds, though bull trout is distributed within the Pembina River watershed as well.

Current levels of disturbance of instream habitat ranging from 0.24-0.37%, with the highest level in the Pembina River watershed. The Project (assuming no trenchless crossings) and reasonably foreseeable development would increase instream disturbance incrementally by < 0.01-0.08%. The highest increase is projected to occur in the Pembina River watershed, and is due primarily to reasonably foreseeable development. The predicted Project-specific contribution ranges from < 0.01-0.01% and would be further reduced by the implementation of proposed trenchless crossings in the Pembina and Lower McLeod watersheds.

The Project's contribution to the potential cumulative effects on Athabasca rainbow trout and bull trout will be reduced through the implementation of mitigation measures recommended in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C). In addition, it is expected that many other land users will implement similar measures, as recommended in federal and provincial guidelines and best management practices (refer to Section 8.6.3.1 above). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed warranted to address the potential cumulative effects on indicator species.

Given that the Project's contribution to combined instream disturbance is < 0.1-0.01%, federal and provincial guidance recommendations will be implemented, and trenchless crossings constructed where practical, the Project's contribution to cumulative effects on Athabasca rainbow trout and bull trout is of low magnitude. The Project's contribution is considered to be reversible in the medium to long-term, depending on the pre-existing channel structure, channel composition, seasonal flow characteristics and potential continued off-highway vehicle activity (Table 8.6-5, point 4[b]). A summary of the rationale for all of the significance criteria of combined cumulative effects on Athabasca rainbow trout and bull trout is provided below.

- Spatial Boundary: Aquatics RSA – Project pipeline disturbance will be confined to the Fish and Fish Habitat LSA, but watershed-scale effects from overlapping disturbance could extend to the RSA.
- Duration: immediate to short-term – Project activities affecting Athabasca rainbow trout and bull trout occurs during the construction phase or maintenance during the operations phase (lasting 2 days to less than 1 year).
- Frequency: isolated to occasional – the Project's contribution to the combined effects on Athabasca rainbow trout and bull trout occur during construction and then intermittently, but sporadically, over the assessment period during maintenance activities.
- Reversibility: medium to long-term – depending upon the pre-construction channel characteristics and future flow regime, and potential continued stream access by off-highway vehicles.
- Magnitude: low – in addition to the construction of trenchless crossings where practical, the Project will implement federal and provincial guidance recommendations (*e.g.*, timing window requirements, restoration of channel profile, bank stabilization measures, tree and shrub plantings to prevent access) and, consequently, Project's contribution to cumulative effects on Athabasca rainbow trout and bull trout is expected to be low.
- Probability: high – it is likely that cumulative effects on Athabasca rainbow trout and bull trout will occur.
- Confidence: high – based on available research literature and the professional experience of the assessment team.

Burbot (Alberta Indicator Species)

As discussed in Section 7.2.7.6, burbot have become more susceptible to natural and anthropogenic habitat disturbance than in the past (Stapanian *et al.* 2010), however, mortality or injury is the greatest contributor to combined effects for this species. Burbot is distributed across all Alberta watersheds in the Aquatics RSA.

Estimated fish injury and mortality hazard, as measured using stream crossing density, currently ranges from 1.52 crossings/km^2 in the Pembina River watershed to 2.66 crossings/km^2 in the Athabasca River watershed, with an overall average of 1.85 crossings/km^2 in the Alberta Aquatics RSA. The Project and reasonably foreseeable developments would slightly increase the stream crossing density in all watersheds (*i.e.*, an increase of 0.01 crossings/km^2), with combined values predicted to remain the highest in Athabasca watershed.

The Project's contribution to the potential cumulative effects on burbot will be reduced through the implementation of mitigation measures recommended in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C). In addition, it is expected that many other land users will implement similar measures, as recommended in federal and provincial guidelines and best management practices (refer to Section 8.6.3.1 above). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed warranted to address the potential cumulative effects on indicator species.

The Project will apply mitigation to reduce construction-related effects and will be located adjacent to existing linear disturbances and clearings where practical, which will create minimal new access for recreational fishermen and harvesters. For these reasons, the Project's contribution to effects associated with burbot within the Alberta Aquatics RSA is of low magnitude. The Project's contribution to cumulative effects on burbot is considered to be reversible in the long-term since harvester access will potentially continue throughout operations (Table 8.6-5, point 4[c]). A summary of the rationale for all of the significance criteria of combined cumulative effects on burbot is provided below.

- Spatial Boundary: Aquatics RSA – Project pipeline disturbance will be confined to the Fish and Fish Habitat LSA, but watershed-scale effects from overlapping disturbance could extend to the RSA.

- Duration: immediate to long-term – Project activities affecting burbot occur during construction (*e.g.*, trench dewatering) and operations (access).
- Frequency: isolated to periodic – Project-related access changes to the combined effects on burbot occur intermittently and sporadically to repeatedly over the assessment period, depending on waterbody location.
- Reversibility: long-term – harvester access will potentially continue throughout operations.
- Magnitude: low – the Project will be located adjacent to existing linear disturbances and clearings where practical which will create minimal new access for recreational fishermen and harvesters, and, consequently, the Project's contribution to cumulative effects on burbot is expected to be low.
- Probability: high – it is likely that cumulative effects on burbot will occur.
- Confidence: high – based on available research literature and the professional experience of the assessment team.

Northern Pike and Walleye (Alberta Indicator Species)

Section 7.2.7.6 indicates that for both northern pike and walleye, weedy shoreline areas represent important habitat. Consequently, loss or alteration of riparian habitat is the greatest contributor to combined effects for these two species. Northern pike is distributed across all Alberta watersheds in the Aquatics RSA, whereas walleye is located in all but the Athabasca and Upper McLeod river watersheds.

The cumulative effects hazard based on riparian disturbance is currently moderate in the Upper McLeod River watershed (*i.e.*, 11.79%) and high in the rest of the Alberta Aquatics RSA, ranging from 19.03-75.63%. The highest level of existing riparian disturbance is in the Lower North Saskatchewan River watershed, and is due primarily to agriculture. Future aquatic cumulative effects hazard (including Project and reasonably foreseeable developments) incrementally increases in all watersheds, ranging from 0.06-1.32%, though the hazard levels will not be affected. The Project incrementally contributes to riparian disturbance from 0.01-0.10%, or an average of 0.03%.

The mitigation measures outlined in Section 7.2.7.4 (*e.g.*, seeding disturbed riparian areas with the appropriate native seed mix along with a quick establishing cover crop, and additional revegetation efforts, such as planting trees or shrubs at select locations), will limit the Project's contribution to cumulative effects. In addition, it is expected that many other land users will implement similar measures, as recommended in federal and provincial guidelines and best management practices (refer to Section 8.6.3.1 above). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed warranted to address the potential cumulative effects on indicator species.

The Project's contribution to cumulative effects associated with northern pike and walleye is of low magnitude given that the Project's contribution is 0.03% of combined riparian disturbance and federal and provincial guidance recommendations will be implemented. The cumulative effect of clearing riparian vegetation is considered to be reversible in the medium to long-term, depending on the pre-existing vegetation community (Table 8.6-5, point 4[d]). A summary of the rationale for all of the significance criteria of combined cumulative effects on northern pike and walleye is provided below.

- Spatial Boundary: Aquatics RSA – Project pipeline disturbance will be confined to the Fish and Fish Habitat LSA, but watershed-scale effects from overlapping disturbance could extend to the RSA.
- Duration: immediate to short-term – Project activities affecting northern pike and walleye occur during the construction phase or maintenance during the operations phase (lasting 2 days to less than 1 year).
- Frequency: isolated to occasional – the Project's contribution to the events causing cumulative effects on northern pike and walleye occurs during construction and then intermittently, but sporadically, over the assessment period during maintenance activities.

- Reversibility: medium to long-term – depending upon the pre-construction vegetation community (*e.g.*, grasses and shrubs regenerate within several years, however, tree canopy regrowth is expected to extend into the long-term) and the extent of clearing or alteration of riparian vegetation required for maintenance activities.
- Magnitude: low – the Project's incremental contribution is 0.05% of the combined riparian disturbance and the Project will implement federal and provincial guidance recommendations to avoid permanent habitat loss, consequently the Project's contribution to cumulative effects on northern pike and walleye is expected to be low.
- Probability: high – it is likely that cumulative effects on northern pike and walleye will occur.
- Confidence: high – based on available research literature and the professional experience of the assessment team.

Bull Trout/Dolly Varden (BC Indicator Species)

As discussed in Section 7.2.7.6, bull trout are susceptible to degraded water and habitat conditions from land disturbance such as roads and oil and gas disturbance (Alberta Sustainable Resource Development [ASRD] 2012, Brewin *et al.* 2001, Hammond 2004) and obstructions to movement (Hammond 2004) which makes contamination, loss or alteration of instream habitat the greatest contributor to combined effects for the bull trout/Dolly Varden indicator. This species has a broad distribution across the BC Aquatics RSA, being present in all but the South Thompson, Harrison and Squamish river watersheds.

Current levels of disturbance of instream habitat range from 0.09-1.01%, with the highest level in the Lower Nicola River watershed. The Project (assuming no trenchless crossings) and reasonably foreseeable development would increase instream disturbance incrementally by 0.02-0.05%. The highest increase is projected to occur in Lower Nicola and Upper North Thompson river watersheds, due primarily to the Project in both cases. The projected Project-specific contribution ranges from 0.01-0.05%, or an average of 0.02%, and the overall average would be further reduced to 0.01% with the implementation of trenchless crossings.

The Project's contribution to the potential cumulative effects on bull trout will be reduced through the implementation of mitigation measures recommended in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C). In addition, it is expected that many other land users will implement similar measures, as recommended in federal and provincial guidelines and best management practices (refer to Section 8.6.3.1 above). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed warranted to address the potential cumulative effects on indicator species.

Given that the Project's contribution to combined instream disturbance is 0.02% in the BC Aquatics RSA, federal and provincial guidance recommendations will be implemented, and trenchless crossings constructed where practical, the Project's contribution to cumulative effects associated with bull trout/Dolly Varden is of low magnitude. The Project's contribution to cumulative effects on this species is considered to be reversible in the medium to long-term, depending on the pre-existing channel structure, channel composition, seasonal flow characteristics and potential for continued off-highway vehicle activity (Table 8.6-5, point 4[e]). The significance rationale of combined effects on bull trout/Dolly Varden is considered to be similar to the rationale for combined effects provided above under the Athabasca rainbow trout and bull trout indicator.

Chinook and Coho Salmon and Cutthroat Trout (British Columbia Indicator Species)

Section 7.2.7.6 indicates that contamination, loss or alteration of instream and riparian habitat are equal contributors to combined effects for these three species, given their sensitivity to habitat degradation. Chinook and coho salmon have a broad distribution across the BC Aquatics RSA though cutthroat trout are limited to the western portion, from the Fraser Canyon westwards.

Cumulative effects hazard resulting from riparian disturbance is currently low in the Upper Fraser River, Canoe Reach and Clearwater River watersheds, moderate in the Upper North Thompson, Fraser

Canyon, Harrison, and Chilliwack river watersheds and high in all remaining watersheds, a similar trend is apparent with instream disturbance. The Project and reasonably foreseeable developments would increase riparian disturbance incrementally in all watersheds, from 0.0-0.48%, though will not affect the hazard level of any of the watersheds. Project-specific riparian disturbance ranges from < 0.01-0.15% and is projected to be highest in the Lower Nicola River watershed. The Project (assuming no trenchless crossings) and reasonably foreseeable developments would increase instream disturbance incrementally by 0.01-0.05% across the watersheds in the BC Aquatics RSA. The projected Project-specific contribution ranges from 0.01-0.05%, for an average of 0.02 and would be further reduced by 0.01% with the implementation of trenchless crossings. The Project's contribution is highest in the Upper North Thompson and Lower Nicola river watersheds (0.05%), though trenchless crossings are proposed in both of these watersheds which would reduce the Project's influence if implemented.

The Project's contribution to the potential cumulative effects on Chinook and coho salmon and cutthroat trout will be reduced through the implementation of mitigation measures recommended in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C). In addition, it is expected that many other land users will implement similar measures, as recommended in federal and provincial guidelines and best management practices (refer to Section 8.6.3.1 above). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed warranted to address the potential cumulative effects on indicator species.

Given the level of riparian and instream disturbance due to the Project as noted above, alignment along existing rights-of-way where possible, and mitigation to reduce construction and operation-related effects, including trenchless crossings where practical, the Project's contribution to potential cumulative effects associated with Chinook and coho salmon and cutthroat trout within the Aquatics RSA is of low magnitude. The cumulative effect of disturbance is considered to be reversible in the medium to long-term, depending upon the pre-construction channel characteristics and pre-construction riparian vegetation community (Table 8.6-5, point 4[f]). The significance rationale of combined effects on Chinook and coho salmon and cutthroat trout is considered to be similar to the rationale for combined effects provided above under the Arctic grayling indicator.

Rainbow Trout/Steelhead (British Columbia Indicator Species)

As discussed in Section 7.2.7.6, rainbow trout are migratory in nature and will move to new areas should habitat conditions change (Natural Resources Conservation Service 2000), therefore, mortality or injury is the greatest contributor to combined effects for this species. Rainbow trout is distributed across all BC watersheds in the Aquatics RSA.

Estimated fish injury and mortality hazard, as measured using stream crossing density, currently ranges from 0.32 crossings/km^2 in the Canoe Reach watershed to 2.38 crossings/km^2 in the South Thompson River watershed, with an overall average of 1.35 crossings/km^2 in the BC Aquatics RSA. The Project and reasonably foreseeable developments would incrementally increase the stream crossing density in all watersheds (*i.e.*, an increase of 0.04 crossings/km^2 across the BC Aquatics RSA), with combined values estimated to remain highest in South Thompson River watershed. The Project contributes 0.02 crossings/km^2 to the combined stream crossing density in the watersheds in the BC Aquatic RSA, with the largest contribution projected in the Upper North Thompson and Lower Nicola river watersheds.

The Project's contribution to the potential cumulative effects on rainbow trout will be reduced through the implementation of mitigation measures recommended in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C). In addition, it is expected that many other land users will implement similar measures, as recommended in federal and provincial guidelines and best management practices (refer to Section 8.6.3.1 above). No mitigation measures beyond the Project-specific mitigation already proposed in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed warranted to address the potential cumulative effects on indicator species.

The Project will apply mitigation to reduce construction-related effects and will be located adjacent to existing linear disturbances and clearings where practical, which will create minimal new access for recreational fishermen and harvesters. For these reasons, the Project's contribution to cumulative effects associated with rainbow trout within the BC Aquatics RSA is of low magnitude. The Project's contribution to cumulative effects on rainbow trout is considered to be reversible in the long-term since harvester access will potentially continue throughout operations (Table 8.6-5, point 4[g]). The significance rationale of combined effects on rainbow trout is considered to be similar to the rationale for combined effects provided above under the burbot indicator.

8.6.3.5 Combined Cumulative Effects on Fish and Fish Habitat

Disturbance from Project activities (*i.e.*, alteration of riparian habitat, alteration of instream habitat, effects on fish mortality and injury) may act in combination with existing and reasonably foreseeable developments to affect fish and fish habitat in the Aquatics RSA, as described above for species of management and public concern. The impact balance is considered negative. The implementation of mitigation measures recommended in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) will reduce the severity of cumulative effects arising from the Project and other reasonably foreseeable developments. The combined cumulative effect of the Project on fish and fish habitat is of low magnitude, reversible in the immediate to long-term and of high probability (Table 8.6-5, point 5[a]). A summary of the rationale for all the significance criteria for Project's contribution to cumulative effects on the fish and fish habitat indicators is provided below.

- Spatial Boundary: Aquatics RSA – Project pipeline disturbance will be confined to the Fish and Fish Habitat LSA and, but watershed-scale effects from overlapping disturbance could extend to the RSA.
- Duration: immediate to long-term – Project activities contributing to combined cumulative effects on fish and habitat occur during the construction phase (*e.g.*, sedimentation from instream activity) and extend to the operations phase (*e.g.*, access).
- Frequency: isolated to periodic – Project related activities contributing to combined cumulative effects on fish and habitat range from isolated activities (*e.g.*, blockage of fish movement during construction) to intermittent, but repeated events over the assessment period (*e.g.*, access related effects).
- Reversibility: immediate to long-term – certain Project effects are reversed immediately, such as removal of a temporary blockage event upon completion of instream work, while other Project-effects, such as disturbance of riparian areas, depend on the preconstruction-vegetation community (*e.g.*, grasses and shrubs regenerate within several years, however, tree canopy re-growth is expected to extend into the long-term).
- Magnitude: low – the Project's contribution to combined cumulative effects on fish and fish habitat is expected to be low because the project will be located along existing linear disturbance where practical, will implement trenchless crossings where practical, and will implement recommended federal and provincial industry standard guidelines.
- Probability: high – it is likely that these cumulative combined effects will occur.
- Confidence: high – based on available research literature and the professional experience of the assessment team.

8.6.4 Summary

As identified in Table 8.6-5, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on fish and fish habitat within the Aquatics RSA will be not significant.

8.7 Wetlands

The below subsection outlines how the Project may contribute to cumulative effects on the wetland loss or alteration indicator in combination with existing activities and reasonably foreseeable developments.

8.7.1 Reasonably Foreseeable Developments

Tables 8A.1-1, 8A.1-2, 8A.1-3 and 8A.1-4 of Appendix 8.1 provide a list of the certain and reasonably foreseeable developments located within the Wetland RSA considered in the evaluation of cumulative effects on the wetland loss or alteration indicator. Description of these developments is provided in Section 8.1.4 and shown on Figures 8.1-1a, 8.1-1b and 8.1-1c. In the Wetland RSA, there are approximately 68 mapped reasonably foreseeable developments either fully within the Wetland RSA or, for some transmission lines and pipelines, partially within the Wetland RSA (Table 8A.1-1 of Appendix 8.1). In addition, there are approximately 2,387 mapped reasonably foreseeable minor oil and gas developments in Alberta: 502 pipelines; 1,617 facilities; and 268 wells (Tables 8A.1-2 to 8A.1-4 of Appendix 8.1).

As indicated in Section 8.1, other reasonably foreseeable developments with the potential to act in combination with the Project were excluded from quantitative evaluations since development details (*e.g.*, approval status, location) were either lacking or the development was located within previously disturbed areas of municipal boundaries, such as the city limits of the City of Edmonton and LMDA. Descriptions of these developments are provided in Section 8.1.4 and Table 8A.1-5 for Alberta and Table 8A.1-6 for BC of Appendix 8.1.

The current level of disturbance due to existing activities within the Wetland RSA as well as the anticipated disturbance attributed to the Project and reasonably foreseeable developments is provided in Tables 8.7-1 and 8.7-2. A hierarchy table was applied during the cumulative effects assessment quantitative analysis to determine priority of overlapping land use features (*i.e.*, features with greater indirect footprint and assumed effects potential are assigned higher priority).

Note: 1 Existing Areal Disturbance does not include the LMDA, but does include the Surrey Greenbelt.

8.7.2 Potential Cumulative Effects

The potential and likely combined environmental residual effects associated with the construction and operation of the Project on the wetland loss or alteration indicator were identified in Section 7.11.1.8 and are listed in Table 8.7-3 along with the identification of existing activities and reasonably foreseeable developments that could act in combination with the Project.

TABLE 8.7-3

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON WETLAND LOSS OR ALTERATION CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Combined effects of the Project on wetland loss or alteration.	RSA	Pipeline Temporary Facilities Pump Stations Pipeline Reactivation	Past Development to Operation	Project contribution to cumulative increase in wetland disturbance.	• Existing activities including: agriculture and livestock grazing, forestry, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including wetland substrate (*i.e.*, peat) salvaging, trenching, backfilling and reclamation, vehicle traffic, and temporary access road and shoo-fly installation and removal, and potential partial wetland infilling (*i.e.*, power line structures).

Note: 1 RSA = Wetland RSA.

8.7.3 Significance Evaluation of Potential Cumulative Effects

A quantitative analysis was conducted to evaluate the significance of the Project's contribution to cumulative environmental effects for the wetland function indicator as these changes over the existing data within the Footprint Study Area were quantifiable. However, as there are no standards, guidelines, objectives or other established and accepted ecological thresholds to define quantitative rating criteria, a qualitative was used for determining the significance of the Project's contribution to cumulative environmental effects. The qualitative assessment for the wetland loss or alteration indicator relied on the professional judgment of the assessment team.

Table 8.7-4 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on the wetland loss or alteration indicator. The rationale used to evaluate the significance of the cumulative effect is provided below.

TABLE 8.7-4

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON WETLAND LOSS OR ALTERATION

Potential Cumulative Effects	Impact Balance	Spatial Boundary[1]	Temporal Context: Duration	Temporal Context: Frequency	Temporal Context: Reversibility	Magnitude	Probability	Confidence	Significance[2]
1. Wetland Loss or Alteration Indicator – Wetland Function									
1(a) Project contribution to cumulative increase in wetland disturbance.	Negative	RSA	Short to long-term	Periodic	Medium to long-term	Low to medium	High	High	Not significant

Notes: 1 RSA = Wetland RSA.

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.7.3.1 Wetland Function

The proposed pipeline corridor travels through 4 ecozones and 11 ecoregions of Canada (Agriculture and Agri-Food Canada 2013, Ecological Stratification Working Group 1995), 5 wetland regions of Canada (Government of Canada 1986), 5 natural subregions of Alberta (Natural Regions Committee 2006) and 9 biogeoclimatic (BGC) zones of BC (BC MFLNRO 2012e, Meidinger and Pojar 1991). Wetlands within the wetland regions comprise between 5% and 40% of the land area (Natural Resources Canada [NRCan] 2009).

A quantitative cumulative effects approach was taken to determine the Project's wetland function disturbance. The wetland area determined for the Wetland LSA and RSA was based on the approximate area of wetlands. The quantitative assessment utilized existing databases (*i.e.*, CanVec for Alberta and the FWA for BC) in order to estimate the area of wetlands potentially disturbed by existing activities, Project-related and reasonably foreseeable developments.

CanVec is a data set that combines information from many databases such as the National Topographic Database, National Road Network and the National Hydrographic Network. CanVec maps approximately 90 different topographical entities. The hydrography level features include lakes, rivers and wetlands (NRCan 2012). When the wetlands identified through satellite imagery interpretation (1:10,000 scale) are overlaid by the CanVec wetland layer it appears that CanVec tends to pick up on larger wetland features that are wetter but misses smaller and often drier wetlands, which may underestimate the number of wetlands without standing water. The satellite imagery interpretation also suggested that CanVec may overestimate the area of some of these wetlands.

The BC FWA is a data set that maps the province's hydrologic features, based on the Terrain Resource Information Management base maps (1:20,000 scale). The BC FWA maps hydrologic features including streams, lakes and wetlands and is intended to be an authoritative source for inventory of freshwater resources in BC (Integrated Land Management Bureau 2010). Interpretation of satellite imagery (1:10,000 scale) overlaid by a BC FWA wetlands layer indicates that although the BC FWA classifies wetlands into only two categories (swamp and marsh), wetland classes such as fens are also captured within the two categories. Satellite imagery interpretation also suggested that the BC FWA underestimates wetland area. Wetlands identified through satellite imagery interpretation were typically at the same location as those in the BC FWA layer but the BC FWA consistently delineated a smaller area of wetland or missed smaller wetlands entirely. The BC FWA wetland features also tended to be centred on open water features or very wet areas, which potentially underestimates wetland areas without standing water.

It should be noted that these comparisons only focused on the areas within the Wetland LSA and not beyond.

As mentioned in Section 8.1.5, larger municipalities, such as the City of Edmonton and the LMDA, were excluded from the quantitative analysis. The portion of the Golden Ears Connector development through a City of Surrey greenbelt was considered, but since no wetlands in the greenbelt are affected by this reasonably foreseeable development or the Project, it was also excluded from the analysis. Effects of the Project on wetlands were addressed in Section 7.2.8. Wetland function was evaluated at each wetland ecosystem encountered during the ground-based field work. Wetland functions documented during the existing (*i.e.*, pre-construction) evaluation will be compared to wetland functions observed along the reclaimed (*i.e.*, post-construction) construction right-of-way. The results of this comparison will be used to confirm the effectiveness and efficiency of mitigation and reclamation measures, and confirm the determination of loss or "no net loss" of wetland function included in the ESA.

Details on each of the wetland functional categories (*i.e.*, High, High-Moderate, Low-Moderate and Low Functional Conditions) can be found in Section 7.2.8.1.

Functional condition categories were documented for all wetlands ground-truthed during the 2012 and 2013 field programs. The sampling intensity determined to be appropriate for this Project is 100%. Of the wetlands identified to be crossed by the proposed pipeline corridor, 59% were ground-truthed during the 2012 and 2013 field programs. Functional assessments will be conducted at the remaining wetlands during supplemental studies. Based on the results of the functional assessments conducted during the

2012 and 2013 field programs and the professional judgment of the wetland assessment team, the functional condition categories were estimated for remaining wetlands within each segment along the proposed pipeline corridor. Categories are to be confirmed during the 2014 supplemental field program. The results of wetland functional condition categories along the proposed pipeline corridor were extrapolated out to the Wetland RSA to approximate wetland coverage and potential functional condition within this study area (Tables 8.7-5 and 8.7-6). Quantitative assessments were conducted for all pipeline segments. Following wetland surveys in 2014, once a final pipeline route has been determined, the assessment will be verified by comparing the 2014 field results to what was estimated during imagery review for the purposes of the cumulative effects assessment.

TABLE 8.7-5

FREQUENCY OF OCCURRENCE OF WETLANDS WITHIN THE PROPOSED PIPELINE CORRIDOR

Metric	Alberta	Alberta (minus Edmonton)	BC[1]	BC (minus LMDA)
Number and area of wetlands encountered (potential and ground-truthed)[2]	339; 382.5 ha	313; 364.8 ha	299; 206.9 ha	256; 191.8 ha
Number and area of wetlands encountered (ground-truthed)[2]	261; 318.2 ha	238; 300.8 ha	115; 122.1 ha	110; 120.1 ha
Number and area of wetlands of High Functional Condition	78; 176.9 ha	77; 174.8 ha	23; 59.3 ha	23; 59.3 ha
Frequency of wetlands of High Functional Condition (%)	29.9	32.4	20.0	20.9
Potential total number and area of wetlands of High Functional Condition	101; 75.7 ha	101; 118.2 ha	59; 41.0 ha	53; 39.7 ha
Number and area of wetlands of High-Moderate Functional Condition	142; 126.2 ha	125; 286.5 ha	74; 49.1 ha	74; 49.1 ha
Frequency of wetlands of High-Moderate Functional Condition (%)	54.4	52.5	64.3	67.3
Potential total number and area of wetlands of High-Moderate Functional Condition	184; 20.8 ha	164; 191.5 ha	191; 132.0 ha	171; 127.9 ha
Number and area of wetlands of Low-Moderate Functional Condition	41; 15.1 ha	396; 12.6 ha	17; 13.6 ha	12; 11.6 ha
Frequency of wetlands of Low-Moderate Functional Condition (%)	15.7	15.1	14.8	10.9
Potential total number and area of wetlands of Low-Moderate Functional Condition	53; 60.1 ha	47; 55.1 ha	44; 30.4 ha	28; 20.7 ha
Number and area of wetlands of Low Functional Condition[4,5]	0[5]; 0.0 ha	0; 0.0 ha	1; 0.1 ha	1; 0.1 ha
Frequency of wetlands of Low Functional Condition (%)[4,5]	0.0	0.0	0.9	0.9

TABLE 8.7-5 Cont'd

Metric	Alberta	Alberta (minus Edmonton)	BC[1]	BC (minus LMDA)
Potential total number and area of wetlands of Low Functional Condition	0; 0.0 ha	0.0	3; 1.9 ha	2; 1.7 ha

Notes:
1 Due to the low sampling frequency experienced along the BC segments as a result of limited land access, the number of wetlands has been combined together for this assessment.
2 Total number of wetlands encountered by the proposed pipeline corridor including potential wetlands and wetlands that have been ground-truthed during the 2012 and 2013 field programs.
3 Ground-truthing and functional assessments were conducted at wetlands where land access permission was available in 2012 and 2013.
4 Based on the results of the ground-based field surveys it is anticipated that wetlands with Low Functional Condition along the Edmonton to Hinton Segment are not common.
5 Wetlands of Low Functional Condition were not documented during the 2012 and 2013 field program. These observations do not conclude that wetlands with this functional condition are not present. These values will be updated following the 2014 supplemental surveys.

TABLE 8.7-6

AREA OF WETLANDS WITHIN THE WETLAND RSA

Province	Area of Wetland RSA (ha)[1]	Area of Wetland RSA (excluding Edmonton and LMDA) (ha)	Area of Wetlands of High Functional Condition (ha)	Area of Wetlands of High-Moderate Functional Condition (ha)	Area of Wetlands of Low-Moderate Functional Condition (ha)	Area of Wetlands of Low Functional Condition (ha)
Alberta	161,125.9	160,998.8	52,163.6	84,524.4	24,310.8	0.0
BC	32,755.8	28,959.4	5,994.6	19,315.9	3,127.6	260.6
Total	193,881.7	189,958.2	58,158.2	103,840.3	27,438.4	260.6

Note: 1 Areas of wetlands with the four functional conditions was determined based on the frequency of occurrence percentage documented in Table 8.7-5.

Permanent loss of wetland function is not anticipated to result from either the construction or operations phases of the proposed pipeline in trenched wetlands or at the pump stations; however, potential permanent loss of wetland function may occur as a result of the construction of the proposed power lines (*e.g.*, Kingsvale) if the placement of power line structures are within wetland boundaries and at a location that compromises overall wetland function The in-wetland structure placement will permanently reduce wetland area and this reduction may result in the overall loss of wetland function depending on the size of wetland and the type of lost habitat. Temporary alteration of wetland function may result during pipeline construction; however, best practices and mitigation measures will be employed to assist with the goal that no long-term or permanent alteration of wetland function will occur. No permanent disturbance to wetlands is anticipated to occur at pump stations.

At locations where wetland function may be lost due to the installation of the Kingsvale power line (*e.g.*, structures placed in wetlands), potential compensation will be discussed with Environment Canada.

Since surface disturbances affect wetland function, existing activities and the Project will act cumulatively to increase disturbance to wetland function in the Wetland RSA. The results of the quantitative analysis of disturbance of wetlands are summarized in Tables 8.7-7 and 8.7-8.

Within the Wetland RSA, approximately 24,576.3 ha (15.3%) of the wetlands have been affected through surface disturbance associated with existing activities in Alberta. It is estimated that 7,962.7 ha of these are wetlands of High Functional Condition, 12,902.6 ha of High-Moderate Functional Condition, 3,711 ha of Low-Moderate Functional Condition and 0.0 ha of Low Functional Condition. In combination with the Project and other reasonably foreseeable developments, the total cumulative disturbance of wetlands within the Wetland RSA in Alberta is predicted to be approximately 24,966.9 ha. This increases the percentage of disturbance of wetlands in the Wetland RSA to 15.5% of which the Project contributes to 0.05% of the total cumulative disturbance of wetlands in the Wetland RSA in Alberta.

Within the Wetland RSA in BC, approximately 1,801.5 ha (6.2%) of the wetlands have been affected through surface disturbance associated with existing activities. It is estimated that 372.9 ha of these are wetlands of High Functional Condition, 1,201.6 ha of High-Moderate Functional Condition, 194.6 ha of Low-Moderate Functional Condition and 16.2 ha of Low Functional Condition. In combination with the Project and other reasonably foreseeable developments, the total cumulative disturbance of wetlands within the Wetland RSA in BC is predicted to be approximately 1,882.4 ha. This increases the percentage of disturbance of wetlands in the Wetland RSA to 6.5% of which the Project contributes to 2.1% of the total cumulative disturbance of wetlands in the Wetland RSA in BC.

TABLE 8.7-7

CUMULATIVE DISTURBANCE OF WETLANDS IN THE WETLAND LSA AND RSA EXCLUDING EDMONTON AND THE LMDA – ALBERTA

Wetland Disturbance Assessment Scenario	Total Area[2]	Area of Wetland RSA			
		High Functional Condition	High-Moderate Functional Condition	Low-Moderate Functional Condition	Low Functional Condition[3]

Total Cumulative Wetland Disturbance (Existing + Project + Likely Future)	1,882.4 ha (6.5%)	389.7 ha	1255.5 ha	203.3 ha	17 ha
% Contribution of Project to Cumulative Wetland Disturbance	2.1%	--	--	--	--

Notes: 1 Calculations based on footprint disturbances provided in Tables 8.7-1 to 8.7-2 and are approximate.
2 Total Area excludes the City of Edmonton and LMDA.
3 Wetlands of Low Functional Condition were not documented during the 2012 and 2013 field program in Alberta. However, wetlands of this functional condition are expected to occur within the Wetland LSA and RSA. These values will be updated following the 2014 supplemental surveys.

The proposed standard and effective mitigation measures to be implemented during construction through wetlands crossed by the Project will reduce cumulative effects on wetland function. No mitigation measures beyond the Project-specific mitigation already proposed under the Wetland Loss or Alteration element in Section 7.0 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are deemed warranted to reduce cumulative effects on wetland function.

For any reasonably foreseeable developments that will also affect wetlands, it is anticipated that mitigation measures that are in accordance with industry standards and provincial and federal guidelines will be implemented by many proponents. In those instances where permanent disturbance to wetland function may be a result of these developments, it is anticipated that compensation would be conducted and will comply with provincial (*i.e.*, Alberta *Water Act*, the new Alberta *Wetland Policy* and the BC *Water Act*) and federal (*i.e.*, *Federal Policy on Wetland Conservation*) legislation.

The Project's contribution to combined disturbance of wetland function is considered to have a negative impact balance. The reversibility of this contribution on wetlands is considered medium to long-term depending on the recoverability of wetland function (*i.e.*, invasive plant species could potentially delay the recovery of native wetland species, and biogeochemical processes and hydrology may be adversely affected until vegetation cover is re-established). It is anticipated that the Project's contribution to cumulative effects on wetland function will be of low to medium magnitude and that the function of wetlands will be restored to the functional condition documented prior to disturbance (*i.e.*, High, High-Moderate, Low-Moderate and Low) (Table 8.7-6, point 1[a]). A summary of the rationale for all of the significance criteria of the Project's contribution to combined cumulative effects on wetland function is provided below.

- Spatial Boundary: Wetland RSA – Project disturbance will be confined to the LSA, but may overlap with other reasonably foreseeable disturbances to extend to the RSA.
- Duration: short to long-term – Project activities that disturb wetlands and contribute to cumulative wetland function loss are anticipated to be conducted during the construction phase or completed within any one year during the operations phase (*i.e.*, short-term) except along segments of the proposed pipeline corridor where activities within wetlands will be prolonged beyond the first year of the operations phase (*e.g.*, potential disturbances to wetlands resulting from power line structure placement) or be initiated during the operations phase and extends for the life of the Project.
- Frequency: periodic – Project activities contributing to cumulative effects on wetland loss or alteration could occur intermittently, but repeatedly over the assessment period (*i.e.*, both construction and maintenance activities).
- Reversibility: medium to long-term – depending on the type of wetland (*e.g.*, shrubby vs. graminoid) and its resilience (*e.g.*, graminoid will quickly recover to graminoid whereas shrubby swamps will regenerate as emergent graminoid-dominant marshes initially), wetland function will be reduced until vegetation can be re-established, grade and natural flow patterns are restored, and sedimentation is controlled. The incremental effects of the power lines (*e.g.*, Kingsvale) on wetland function are expected to be reversible in the long-term following the potential completion of wetland compensation efforts, if required.
- Magnitude: low to medium – the Project's contribution to cumulative wetland disturbance is considered to be within environmental standards since industry standard, and federal and provincial recommended guidelines and/or mitigation measures will be implemented, as well the loss of wetland function resulting from the proposed power lines (*i.e.*, power line structures) may be potentially compensated and will be discussed with Environment Canada.
- Probability: high – disturbance of wetlands is likely to occur as a result of the Project acting in combination with existing activities and reasonably foreseeable developments.
- Confidence: high – based on experience with similar projects within the Wetland RSA, the results of the wetland surveys and the professional experience of the assessment team.

8.7.4 Summary

As identified in Table 8.7-6, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on wetland function within the Wetland RSA will be not significant.

8.8 Vegetation

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to contribute to cumulative effects on vegetation indicators that were anticipated to have an adverse combined Project-specific residual effect (*i.e.*, vegetation communities of concern, plant and lichen communities of concern, and presence of Infestations of Provincial Weed Species and Other Invasive Non-Native Species Identified as a Concern).

Relevant regulatory guidelines, ATK, TEK, ecological context and residual Project effects were considered in the characterization of potential cumulative effects for vegetation indicators. TEK participants identified the potential long-term and cumulative impacts of pipeline construction on vegetation as a concern. Additional information on vegetation TEK collected during field studies for the Project is provided in the Vegetation Technical Report of Volume 5C.

8.8.1 Reasonably Foreseeable Developments

Tables 8A.1-1 to 8A.1-4 of Appendix 8.1 provide a list of the reasonably foreseeable developments located within the Vegetation RSA considered in the evaluation of quantitative cumulative effects on the vegetation indicators. Descriptions of these developments are provided in Section 8.1.4 and shown on Figures 8.1-1a, 8.1-1b and 8.1-1c. In the Vegetation RSA, there are approximately 15 mapped reasonably foreseeable developments either fully within the Vegetation RSA or, for some transmission lines and pipelines, partially within the Vegetation RSA (Table 8A.1-1 of Appendix 8.1). In addition, there are approximately 42 mapped minor oil and gas developments proposed in Alberta: 14 pipelines; 21 facilities; and 7 wells (Tables 8A.1-2 to 8A.1-4 of Appendix 8.1).

As indicated in Section 8.1, other reasonably foreseeable developments with the potential to act in combination with the Project were excluded from quantitative evaluations since development details (*e.g.*, approval status, location) were either lacking or the development was located within previously disturbed areas of municipal boundaries, such as the city limits of the City of Edmonton and LMDA. Descriptions of these developments are provided in Section 8.1.4 and Table 8A.1-5 for Alberta and Table 8A.1-6 for BC of Appendix 8.1.

The current level of vegetation disturbance due to existing activities within the Vegetation RSA as well as the anticipated disturbance attributed to the Project and reasonably foreseeable developments is provided in Tables 8.8-1 and 8.8-2. A hierarchy table was applied during the cumulative effects assessment quantitative analysis to determine priority of overlapping land use features (*i.e.*, features with greater indirect footprint and assumed effects potential are assigned higher priority).

Notes: 1 The disturbance in the above table does not include the LMDA in BC, but does include the Surrey Greenbelt proposed disturbance.

2 Future harvesting activities are detailed in the Managed Forest Areas and Forest Health Technical Report of Volume 5D.

8.8.2 Potential Cumulative Effects

The potential and likely combined environmental residual effects associated with the construction and operation of the Project on vegetation indicators were identified in Section 7.11.1.9 and are listed in Table 8.8-3 along with the identification of existing activities and reasonably foreseeable developments that could act in combination with the Project.

TABLE 8.8-3

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON VEGETATION CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Combined effects of the Project on vegetation communities of concern.	RSA	Pipeline Temporary Facilities Pump Stations (Gainford, Hinton, Blackpool, Rearguard, Darfield, Black Pines, Kingsvale) Power lines (Black Pines, Kingsvale) Tanks (Sumas, Burnaby) Pipeline Reactivation	Construction to Operation	Project contribution to incremental increase in alteration or disturbance of native vegetation. Project contribution to incremental increase in alteration or disturbance of rare ecological communities. Project contribution to incremental increase in alteration or disturbance of grassland communities in the Bunchgrass (BG) BGC Zone.	• Existing activities including: agriculture and livestock grazing, forestry, recreation, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development, and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA are listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including clearing, topsoil/root zone material salvaging, storing and replacement, grading, backfilling, seed mix selection, reclamation and operation (vegetation control, monitoring and maintenance).
2. Combined effects of the Project on plant and lichen species of concern.	RSA	Pipeline Temporary Facilities Pump Stations (Blackpool, Rearguard, Kamloops, Black Pines, Kingsvale) Pines, Kingsvale) Tanks (Sumas, Burnaby) Pipeline Reactivation	Construction to Operation	Project contribution to incremental increase in alteration or disturbance of rare plant and rare lichen populations, if mitigation does not completely protect the site.	• Existing activities including: agriculture and livestock grazing, forestry, recreation, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development, and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including clearing, topsoil/root zone material salvaging, storing and replacement, grading, backfilling, seed mix selection and reclamation.
3. Combined effects of the Project on weeds and other non-native species.	RSA	Pipeline Temporary Facilities Pump Stations Tanks Westridge Marine Terminal Pipeline Reactivation	Construction to Operation	Project contribution to weed introduction or spread.	• Existing activities including: agriculture and livestock grazing, forestry, recreation, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development, and mineral resource exploration and development. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities where equipment will operate or travel in areas lacking a vegetative cover including clearing, topsoil/root zone material salvaging, storing and replacement, seed mix selection, reclamation and operation (vegetation control, monitoring and maintenance).

Note: 1 RSA = Vegetation RSA.

8.8.3 Significance Evaluation of Potential Cumulative Effects

A quantitative approach was selected to determine the cumulative effect of the Project on the vegetation communities of concern indicator since the change to this parameter over existing conditions can be quantified. However, as there are no standards, guidelines, objectives or other established and accepted ecological thresholds to define quantitative rating criteria, a qualitative method for determining the significance of the anticipated Project's contribution to cumulative environmental effects was applied. This qualitative evaluation of significance relied on the professional judgment of the assessment team.

Table 8.8-4 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on vegetation indicators. The rationale used to evaluate the significance of each of the cumulative effects is provided below.

TABLE 8.8-4

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON VEGETATION

	Potential Cumulative Effects	Impact Balance	Spatial Boundary[1]	Temporal Context			Magnitude	Probability	Confidence	Significance[2]
				Duration	Frequency	Reversibility				
1.	Vegetation Indicator – Vegetation Communities of Concern									
1(a)	Project contribution to incremental increase in alteration or disturbance of native vegetation.	Negative	RSA	Short-term	Isolated to periodic	Medium to long-term	Low to medium	High	High	Not significant
1(b)	Project contribution to incremental increase in alteration or disturbance of rare ecological communities.	Negative	RSA	Short-term	Isolated	Medium to long-term	Medium	High	High	Not significant
1(c)	Project contribution to incremental increase in alteration or disturbance of grassland communities in the BG BGC Zone.	Negative	RSA	Short-term	Isolated to periodic	Short to long-term	Medium	High	High	Not significant
1(d)	Project contribution to combined incremental increase in alteration or disturbance of vegetation communities of concern.	Negative	RSA	Short-term	Isolated to periodic	Medium to long-term	Medium	High	High	Not significant
2.	Vegetation Indicator – Plant and Lichen Species of Concern									
2(a)	Project contribution to incremental increase in alteration or disturbance of rare plant and rare lichen populations, if mitigation does not completely protect the site.	Negative	RSA	Short-term	Isolated to periodic	Medium to long-term	Medium	High	High	Not significant

Notes: 1 RSA = Vegetation RSA.

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.8.3.1 Vegetation Indicator – Vegetation Communities of Concern

The following provides the evaluation of significance of the Project's contribution to cumulative effects on the vegetation communities of concern indicator.

Project Contribution to Incremental Increase in Alteration or Disturbance of Native Vegetation

Although some previous clearing has occurred in the Vegetation RSA for the Project, most of the vegetation communities within the Vegetation RSA in BC remain intact. The Project parallels existing disturbance for 89% of its length. The east and west ends of the Project are areas with a high level of anthropogenic disturbance (*i.e.*, Edmonton and LMDA). The land use in the Vegetation RSA along the Edmonton to Hinton Segment is mostly anthropogenic (*e.g.*, cultivation, pasture, roads) with between 25% and 39% native vegetation. The amount of native vegetation in the Vegetation RSA in BC is much higher than Alberta, with between 63% and 76% native vegetation. There are agricultural areas around Kamloops, but the degree of anthropogenic disturbance in the Vegetation RSA is comparatively low along the BC segments of the Project.

Since clearing activities involve the removal of trees, existing activities, the Project and reasonably foreseeable developments (as identified in Appendix 8.1) will act cumulatively to affect vegetation communities in the Vegetation RSA.

Existing activities that have resulted in the alteration of the composition of native vegetation include agriculture (including grazing), rural and urban residential and commercial development, transportation and infrastructure development (*e.g.*, road and rail networks), utility activities, forestry, mineral resource exploration and development, ongoing recreational activities as well as oil and gas exploration and development (*e.g.*, seismic cutlines, pipelines). The amount of disturbance to native vegetation and clearing in the area as a result of the Project is reduced by paralleling existing pipeline rights-of-way for approximately 89% of the Project length. Trans Mountain is expected to further reduce the amount of disturbance to native vegetation by using existing rights-of-way as temporary workspace and siting temporary facilities such as work camps and stockpile sites on existing disturbances, where feasible.

Reasonably foreseeable developments which involve clearing activities in the Vegetation RSA are identified in Tables 8A.1-1 to 8A.1-4 of Appendix 8.1 and include oil and gas pipelines, facilities (*e.g.*, batteries, satellites) and wells. In Alberta, reasonably foreseeable developments are mostly minor oil and gas developments, with a few major developments such as the Vista Project. In BC, reasonably foreseeable developments are mostly proposed hydroelectric projects (*e.g.*, Deneau Creek project), with a few major developments such as the Ajax Project. Reasonably foreseeable developments in the Vegetation RSA, which may result a change to native vegetation, include the Edmonton to Hardisty Pipeline Project, the proposed Parkland Airport (Phase 1), the Vista Project, the Kingsvale – Oliver Natural Gas Pipeline Reinforcement Project, the Interior-Lower Mainland Transmission Project, the Merritt Area Transmission Project, the Deneau Creek Hydroelectric Project, the Emory Creek Hydroelectric Project, the Patterson Creek Nano Hydro Project, the Peers Creek Hydroelectric Project, the Ajax Project and the Gateway Program – Port Mann Bridge/Highway 1 Improvements – Golden Ears Connector (see Table 8A.1-1 of Appendix 8.1 for details). Construction activities for the Project and reasonably foreseeable developments will require clearing of lands supporting native vegetation. Consequently, existing activities, the Project and reasonably foreseeable developments will act cumulatively to affect the native vegetation community composition within the Vegetation RSA.

The results of the quantitative analysis of vegetation disturbance are summarized in Tables 8.8-1 and 8.8-2. The areas of disturbance were calculated using a disturbance layer on GIS imagery. Within the Vegetation RSA, approximately 41,450.4 ha in Alberta and 33,864.6 ha in BC, for a total of 75,315 ha of the vegetation has been removed or altered by disturbances associated with existing activities.

The Project is predicted to create approximately 456 ha of new disturbance in Alberta and 1,602 ha in BC, for a total of 2,058 ha of new disturbance. Disturbance attributable to reasonably foreseeable developments in Alberta is predicted to be approximately 256 ha and 312 ha in BC, for a total of 568 ha. Total predicted new disturbance is 2,626 ha. The Project is predicted to contribute 78% of the predicted total new disturbance of vegetation in the Vegetation RSA. This analysis is limited by the number of reasonably foreseeable developments with spatial data available (for example, cutblocks which are a large source of existing disturbance but for no spatial data were available for anticipated future tree harvest).

When existing disturbance is combined with the Project and reasonably foreseeable developments, the total cumulative disturbance of vegetation in the Vegetation RSA is predicted to be approximately

42,162 ha in Alberta and 35,779 ha in BC, for a total of 77,941 ha. The Project is predicted to contribute 3% of the predicted total cumulative (*i.e.*, existing plus Project and reasonably foreseeable developments) disturbance of vegetation.

The amount of disturbance to native vegetation as a result of the Project will be reduced by paralleling existing linear disturbances for approximately 89% of the proposed pipeline corridor and confining facility expansions to previously disturbed lands where feasible. Vegetation communities located along the Project Footprint will have the potential to be altered such that their overall abundance may be reduced, although different native vegetation communities (*e.g.*, early seral stage communities [forb and shrub]) will be established following revegetation.

Although proposed facilities for the Project have been located on previously disturbed lands to the greatest extent practical, clearing of approximately 166.1 ha of native vegetation will be necessary at the Gainford, Hinton, Rearguard, Kingsvale and Black Pines pump stations, as well as at the Sumas Terminal and along the Kingsvale and Black Pines power lines.

Many of the reasonably foreseeable developments are large-scale projects and are anticipated to be constructed and operated adopting best management practices and mitigation similar to those recommended for the Project. There are smaller-scale reasonably foreseeable developments, such as the hydroelectric projects, that are anticipated to be constructed using best management practices with similar objectives as the Project's mitigation. These small-scale projects will likely use equivalent mitigation that is appropriate to their size and scale. Consequently, most cumulative effects of the Project and reasonably foreseeable developments are primarily attributed to an alteration, rather than complete removal, of native vegetation.

TABLE 8.8-5

CUMULATIVE DISTURBANCE OF NATIVE VEGETATION IN THE VEGETATION RSA

Native Vegetation Disturbance Assessment Scenario	Area and Percentage of Vegetation RSA[1]
Existing Native Vegetation	
Area of the Vegetation RSA	202,722.2 ha
Amount of Native Vegetation	127,407.2 ha (63%)
Estimated Future Native Vegetation Disturbance	
Amount of Native Vegetation Disturbance Attributed to the Proposed Pipeline[2]	1,892.2 ha
Amount of Native Vegetation Disturbance Attributed to Proposed Above Ground Facilities for the Project	4.6 ha
Amount of Native Vegetation Disturbance Attributed to Proposed Power Lines for the Project	161.5 ha
Amount of Native Vegetation Disturbance Attributed to Reasonably Foreseeable Developments (Likely Future)[3]	567.9 ha
Predicted Cumulative Native Vegetation Degradation	
Total Remaining Native Vegetation Following Cumulative Disturbance (Existing+Project+Likely Future)	124,781 ha
Total Remaining Native Vegetation Following Cumulative Disturbance without Project (Existing+Likely Future)	126,839 ha
% Contribution of Project to Cumulative Native Vegetation Disturbance in the Vegetation RSA	3%

Sources: Refer to Table 8.1-1 for data sources used for land use features.

Notes:
1 Calculations based on footprint disturbances provided in Tables 8.8-1 and 8.8-2 and are approximate.
2 Calculation based on TEM.
3 The estimated area resulting from the construction of reasonably foreseeable developments within the Vegetation RSA for the Project (see Tables 8A.1-1 through 8A.1-4 of Appendix 8.1).

Cumulative change (*i.e.*, disturbance) estimates for native vegetation in the Vegetation RSA are summarized in Table 8.8-5. Native vegetation currently comprises approximately 127,407 ha (63%) of the Vegetation RSA. The total cumulative disturbance to native vegetation attributed to existing activities, the Project and reasonably foreseeable developments is predicted to be approximately 77,941 ha. Native vegetation disturbance from reasonably foreseeable developments is likely underestimated because spatial disturbance data were not available for most developments. The Project accounts for an incremental decrease of 3% to the remaining native vegetation in the Vegetation RSA.

None of the most affected native vegetation communities discussed in the Vegetation sections of Sections 5.0 through 7.0 are predicted to be affected by reasonably foreseeable developments. None of the reasonably foreseeable developments with spatial information available are located on any of the ecosites or variants identified in Tables 7.2.9-5 and 7.2.9-6. Therefore, the Project will be the only contribution to incremental alteration or disturbance of native vegetation within the identified ecosites or variants.

By preserving native vegetation using the mitigation suggested in Section 7.2.9 and the Pipeline and Facilities EPPs (Volumes 6B and 6C), the Project will achieve the objectives of the land use plans for the areas traversed by the Project. Objectives of the management plans include maintaining natural vegetation throughout the development process, preserving natural vegetation including trees in all undeveloped and riparian areas and discouraging further clearing or development in areas where native vegetation is important for soil conservation, water resources protection or wildlife habitat (City of Kamloops 2004, 2011, Inter-Agency Planning Team 2009, Strathcona County 2007, TNRD 2000, 2011, Town of Edson 2006, Yellowhead County 2005, 2006, 2007). See Appendix 7.1 of Section 7.0 for more details of the land use plan objectives related to vegetation.

Disturbed areas through native vegetation will be allowed to naturally revegetate or will be seeded with the appropriate seed mix. The proposed standard and effective mitigation measures to be implemented during construction, through native vegetation crossed by the construction right-of-way, will reduce cumulative effects on native vegetation. Consequently, the Project's contribution to cumulative are primarily related to a change in vegetation rather than a loss of vegetation.

Permanent loss of native vegetation is not anticipated to result from either the construction or operation of the proposed pipeline; however, long-term loss of native vegetation may occur during the construction of the proposed pump stations (*e.g.*, Gainford, Hinton, Rearguard, Kingsvale and Black Pines), terminals (*i.e.*, Sumas) and associated power lines (*i.e.*, Black Pines, Kingsvale) depending on the placement of the pump stations, terminals and the power line towers. Temporary alteration of native vegetation may result during pipeline construction; however, mitigation measures described in Section 7.2.9 will be implemented to ensure that no long-term or permanent alteration of native vegetation will occur. Reasonably foreseeable developments in the Vegetation RSA which may result in long-term loss of native vegetation include the Vista Project, the Ajax Project, the Interior-Lower Mainland Transmission Project, the Merritt Area Transmission Project, the Deneau Creek Hydroelectric Project, the Emory Creek Hydroelectric Project, the Patterson Creek Nano Hydro Project, the Peers Creek Hydroelectric Project and the Gateway Program – Port Mann Bridge/Highway 1 Improvements – Golden Ears Connector depending on the placement of the pump stations, terminals and the power line towers. Permanent loss of native vegetation is not anticipated to result from either the construction or operation of the Edmonton to Hardisty Pipeline Project, the proposed Parkland Airport (Phase 1) (which is predicted to be located on agricultural lands) or the Kingsvale – Oliver Natural Gas Pipeline Reinforcement Project (see Table 8A.1-1 of Appendix 8.1 for details). No additional mitigation measures beyond the Project-specific mitigation already proposed in Section 7.2.9 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) are warranted.

The overall cumulative effects of the Project and reasonably foreseeable developments on native vegetation within the Vegetation RSA are considered to be reversible in the medium-term (*e.g.*, effects of proposed pipelines such as the Kingsvale/Oliver Natural Gas Pipeline Reinforcement Project or transmission lines) to long-term or permanent (*e.g.*, effects of facility developments), depending on the affected area (*e.g.*, forb versus tree) and of low to medium magnitude.

The Project is predicted to have a limited (3%) incremental contribution to cumulative alteration of native vegetation in the Vegetation RSA. Consequently, the Project's contribution to cumulative incremental change of native vegetation community composition within the Vegetation RSA is considered to be of low to medium magnitude and is considered reversible in the medium to long-term, depending on the associated land use, the type of activity (*i.e.*, temporary facility, power line, pump station) and the time required for various native species to regenerate following disturbance (Table 8.8-4, point 1[a]). A summary of the rationale for all the significance criteria of combined cumulative effects on native vegetation is provided below.

- Spatial Boundary: Vegetation RSA – the Project's contribution to cumulative effects on native vegetation may interact with reasonably foreseeable developments within the Vegetation RSA to cause a cumulative alteration to vegetation composition in the RSA.
- Duration: short-term – Project's activities that contribute to cumulative changes to native vegetation composition would occur during the construction phase or be completed within any one year during the operations phase. Maintenance activities (*i.e.*, vegetation management on power line rights-of-way) may occur throughout the life of the Project.
- Frequency: isolated to periodic – the Project's contribution to cumulative changes in the composition of native vegetation will occur during construction and intermittently but repeatedly during operations and maintenance activities.
- Reversibility: medium to long-term – depending upon the associated land use, the type of activity (*i.e.*, temporary facility, power line, pump station) and the growth time required for species in each affected area (*e.g.*, forb versus tree), the Project's contribution to changes to native vegetation community composition are considered reversible in the medium to long-term.
- Magnitude: low to medium – the Project's contribution to incremental cumulative change to native vegetation community composition is 3% of the Vegetation in the Vegetation RSA, which is considered to be within environmental standards given that best practices, objectives and provincial guidelines are being followed.
- Probability: high – it is likely that proposed clearing activities for the Project will combine with reasonably foreseeable developments and past clearing for existing activities to affect native vegetation.
- Confidence: high – based on experience from past pipeline projects and the professional experience of the assessment team.

Project Contribution to Incremental Increase in Alteration or Disturbance of Rare Ecological Communities

Rare ecological communities with potential to occur in the Vegetation RSA are found on lands supporting native vegetation. The desktop review conducted prior to the vegetation surveys identified several previously identified rare ecological communities within the Vegetation RSA. Areas of native vegetation with high potential to support rare ecological communities are known to occur in the Vegetation RSA, and a low number of records of previously identified rare ecological communities may be a result of low survey effort in the area rather than an actual lack of rare ecological communities (Alberta Conservation Information Management System [ACIMS] 2013 or the BC Conservation Data Centre [BC CDC] 2012).

Rare plant surveys were conducted during the growing season in 2013 on lands where access was granted as a component of the vegetation surveys. Supplemental ground-based rare plant surveys are planned to be conducted prior to construction in some areas with high potential habitat for rare ecological communities that were not surveyed in 2013, as well as in some areas where access was not available and sites where rare ecological communities need to be confirmed (see Section 9.0).

During the 2013 vegetation surveys, 25 occurrences of ACIMS and BC CDC-listed rare ecological communities (12 distinct rare ecological community types) were documented, as well as one unique ecological community not listed by ACIMS or the BC CDC. Protection measures and environmental management techniques for these rare ecological communities and any others discovered during supplemental studies are provided in Appendix C of the Pipeline and Facilities EPPs (Volumes 6B and 6C).

Indirect alteration of rare ecological communities adjacent to the Project may occur due to soil erosion. Since the areas with greatest erosion risk will be seeded with native species or an annual cover crop (or otherwise stabilized with mulch, straw, crimping), the indirect alteration of native vegetation as a result of erosion will not measurably contribute to the overall effect of the Project on the alteration of rare ecological communities.

Given that indirect effects are, in part, caused by disturbance to vegetation structure associated with clearing activities, allowing disturbed areas to naturally revegetate may not alleviate indirect effects where vegetation management is conducted or long-term persistence of the disturbance exists. Consequently, indirect effects to vegetation are expected to persist until the pre-existing vegetation composition and structure is restored.

Since ground disturbance will be associated with the Project and reasonably foreseeable developments (as identified in Table 8.8-1), combined future disturbance could act cumulatively with existing activities to affect rare ecological communities in the Vegetation RSA.

Lands within the Vegetation RSA include approximately 127,407 ha (63%) of native vegetation, while the remaining areas have previously been converted to non-native cover types where rare ecological communities are unlikely to persist. Loss or alteration of native vegetation attributed to existing activities associated with land use change (*i.e.*, agricultural activities, rural and urban residential development) precludes the ability to determine the extent to which previously existing or remnant rare ecological communities in the Vegetation RSA have been altered. However, the potential for rare ecological communities is highest on lands with contiguous native vegetation and, therefore, construction activities for the Project and reasonably foreseeable developments may act cumulatively to alter remaining or previously unaffected rare ecological communities in the Vegetation RSA. Details of reasonably foreseeable developments that may act cumulatively with construction of the proposed pipeline and facilities are provided in Section 8.1.4 and Tables 8A.1-1 to 8A.1-6 of Appendix 8.1.

The presence and abundance of rare ecological communities along the proposed pipeline corridor were assessed during early and late-season vegetation surveys in 2013 (see the Vegetation Technical Report of Volume 5C). Implementation of site and species-specific mitigation measures outlined in Section 7.2.9 and the Pipeline EPP of Volume 6B is expected to reduce the magnitude and shorten the period of reversibility for residual effects to known rare ecological communities. Mitigation measures that were implemented during construction of the TMX Anchor Loop Project are similar to those that have been recommended for construction of this Project. Additionally, disturbed areas supporting native vegetation or wetlands will be left to naturally regenerate or will be seeded with an appropriate native seed mixture. Many of the reasonably foreseeable developments are large-scale projects and are anticipated to be constructed and operated adopting best practices and mitigation similar to those recommended for the Project. There are smaller-scale reasonably foreseeable developments, such as the hydroelectric projects, that are anticipated to be constructed using best management practices with similar objectives as the Project's mitigation. These small-scale projects will likely use equivalent mitigation that is appropriate to their size and scale. Consequently, additional mitigation measures to reduce combined cumulative effects are not warranted.

For any rare ecological communities identified along the proposed pipeline corridor during future rare plant surveys (see Section 9.0), appropriate site-specific protection measures outlined in the Plant Species and Ecological Communities of Concern Discovery Contingency Plan (Appendix B of the Pipeline EPP [Volume 6B]) will be implemented. The appropriate mitigation will be selected so that the rare ecological communities, particularly S1 communities if identified, are not placed at risk. To this end, Trans Mountain will report any rare ecological communities identified to the provincial conservation data centre (*i.e.*, BC CDC or ACIMS).

With proper implementation of the industry-accepted standard mitigation practices that are proposed, disruption of surface flow patterns and light levels following construction or maintenance activities is expected to be minor along the proposed pipeline corridor. However, construction activities may contribute to some localized alteration of sunlight levels and natural surface drainage patterns until trench settlement is complete and seeded vegetation has matured. No additional mitigation measures beyond the Project-specific mitigation already proposed in Section 7.2.9 and the Pipeline EPP of Volume 6B are deemed warranted.

Overall cumulative effects on rare ecological communities within the Vegetation RSA are considered to be reversible in medium to long-term and of medium magnitude. It may take more than one year plus adequate precipitation levels in order for the trench crown to settle and natural drainage patterns to be restored to pipeline corridors (*e.g.*, Edmonton to Hardisty Pipeline Project), and it will take several years (medium-term) for vegetation to grow back to former heights, which will prevent increased light from reaching surrounding plants in the ecological community. It may take more than 10 years (long-term) for natural drainage patterns to be restored to mine projects (*e.g.*, Ajax Project, Vista Project) and vegetation may not grow back for the life of these projects.

The Project's contribution to cumulative effects on rare ecological communities is considered to be reversible in the medium to long-term, depending on the species/communities affected and of medium magnitude (Table 8.8-4, point 1[b]). A summary of the rationale for all the significance criteria of combined cumulative effects on rare ecological communities is provided below.

- Spatial Boundary: Vegetation RSA – residual Project effects on rare ecological communities could interact with reasonably foreseeable developments within the Vegetation RSA to cause a cumulative alteration to vegetation composition in the RSA.
- Duration: short-term – the Project's contribution to cumulative changes to disturbance or alteration of rare ecological communities would occur during the construction phase or be completed within any one year during the operations phase. Maintenance activities (*i.e.*, vegetation management on power line rights-of-way) may occur throughout the life of the Project, but once the native vegetation (which provides potential habitat for rare ecological communities) is cleared, there is a low probability of rare ecological communities revegetating the area. Therefore, maintenance activities completed more than one year after construction will not further disturb or alter rare ecological communities.
- Frequency: isolated – the Project's contribution to cumulative changes in the disturbance or alteration of rare ecological communities will occur during construction (*e.g.*, clearing native vegetation, which provides habitat for rare ecological communities).
- Reversibility: medium to long-term – depending on the component species (*e.g.*, western redcedar and amabilis fir [amabilis fir - western redcedar/devil's club community] will take years to grow to mature trees, compared to common cattails [common cattail marsh] or beaked sedge [beaked sedge marsh] which can recolonize or re-establish in one growing season if the seed bank and habitat is available), the type of development (*e.g.*, facility, power line, pipeline) and associated land use.
- Magnitude: medium – the Project's contribution to combined disturbance or alteration of a rare ecological community is of medium magnitude because best practices and past precedents typically require additional mitigation like those proposed for the Project to avoid unacceptable effects and reduce cumulative effects.
- Probability: high – the proposed pipeline corridor crosses 25 known occurrences of rare ecological communities and reasonably foreseeable developments are likely to cross areas of native vegetation with potential to support rare ecological communities.
- Confidence: high – based on past pipeline projects, the professional experience of the assessment team and the results of post-construction environmental monitoring of past pipeline projects under similar conditions.

Project Contribution to Incremental Increase in Alteration or Disturbance of Grassland Communities in the Bunchgrass Biogeoclimatic Zone

The proposed pipeline corridor was routed along the existing TMPL right-of-way and other linear disturbance to the extent practical. No pump stations or facilities are currently proposed in the Bunchgrass Biogeoclimatic Zone. The Merritt Area Transmission Project is the only reasonably foreseeable development with known spatial information located within the Vegetation RSA in the BG BGC Zone.

Since ground disturbance will be associated with the Project and reasonably foreseeable developments (*i.e.*, the Merritt Area Transmission Project), these combined future disturbances would act cumulatively with existing activities to affect bunchgrass vegetation communities in the Vegetation RSA (Table 8.8-6).

TABLE 8.8-6

CUMULATIVE DISTURBANCE OF NATIVE VEGETATION IN THE VEGETATION RSA WITHIN THE BG BGC ZONE

Native Vegetation Disturbance Assessment Scenario	Area of Vegetation RSA[1]
Existing Native Vegetation	
Amount of Native Grassland Vegetation (Variants BGxh1 and BGxh2) within the BG BGC Zone[2]	6,372.9 ha
Estimated Future Native Vegetation Disturbance	
Amount of Native Vegetation Disturbance Attributed to the Proposed Pipeline[2]	88.6 ha
Amount of Native Vegetation Disturbance Attributed to Proposed Above Ground Facilities for the Project	0 ha
Amount of Native Vegetation Disturbance Attributed to Proposed Power Lines for the Project	0 ha
Amount of Native Vegetation Disturbance Attributed to Reasonably Foreseeable Developments (Likely Future) [3]	5.9 ha
Predicted Cumulative Native Vegetation Degradation	
Total Existing Disturbance in the BG BGC	2,069.4 ha
Total Remaining Native Vegetation Following Cumulative Disturbance (Existing+Project+Likely Future)	4,209.0 ha
Total Remaining Native Vegetation Following Cumulative Disturbance without Project (Existing+Likely Future)	4,297.6 ha
% Contribution of Project to Cumulative Native Vegetation Disturbance in the Vegetation RSA	4%

Source: Refer to Table 8.1-1 for data sources used for land use features.

Notes:
1 Calculations based on footprint disturbances provided in Tables 8.8-1 and 8.8-2 and are approximate.
2 Calculation based on TEM.
3 The estimated area resulting from the construction of reasonably foreseeable developments within the Vegetation RSA for the Project (see Tables 8A.1-1 through 8A.1-4 of Appendix 8.1).

Cumulative change (*i.e.*, disturbance) estimates for native grassland vegetation in the Vegetation RSA within the BG BGC Zone are summarized in Table 8.8-6. Native grassland vegetation currently comprises approximately 6,372.9 ha of the Vegetation RSA in the BG BGC Zone. The total cumulative disturbance to native grassland vegetation in the BG BGC Zone attributed to existing activities, the Project and reasonably foreseeable developments is predicted to be approximately 2,163.9 ha. Native grassland vegetation disturbance from reasonably foreseeable developments is likely underestimated because spatial disturbance data were not available for most developments. The Project accounts for an incremental decrease of 4% to the remaining native grassland vegetation in the Vegetation RSA.

Although areas disturbed during construction and occasional maintenance activities will be allowed to naturally regenerate or revegetate with the appropriate native species, species composition in the disturbed Footprint will likely be altered as a result of the Project and the Merritt Area Transmission Project. The extent of altered vegetation communities from the Project will be limited by the implementation of mitigation measures outlined in Table 7.2.9-2 and reclamation measures will speed the recovery of grassland communities. The Merritt Area Transmission Project is expected to follow best practices and regional land use guidance and objectives. No additional mitigation measures beyond the Project-specific mitigation already proposed in Section 7.2.9 and the Pipeline EPP (Volume 6B) are deemed warranted. Consequently, the overall cumulative effects on grassland communities within the BG BGC Zone is considered to be of medium magnitude given there are no standards or thresholds that would otherwise indicate loss or alteration of native grassland vegetation is unacceptable.

The Project's contribution to cumulative effects on grassland communities within the BG BGC Zone is limited to the Vegetation RSA, reversible in the short to long-term and of medium magnitude since indirect effects following mitigation will not be acute and the Project is routed along other linear corridors to the extent practical (Table 8.8-4, point 1[c]). A summary of the rationale for all the significance criteria of combined cumulative effects on grassland communities within the BG BC Zone is provided below.

- Spatial Boundary: Vegetation RSA – Project effects on grassland communities in the BG BGC Zone could interact with reasonably foreseeable developments (*i.e.*, the Merritt Area Transmission Project) within the Vegetation RSA to cause a cumulative alteration to grassland communities in the RSA.
- Duration: short-term – Project activities contributing to cumulative disturbance or alteration of bunchgrass vegetation communities will occur during the construction phase or be completed within any one year during the operations phase of the Project and reasonably foreseeable developments.

- Frequency: isolated to periodic – the Project's contribution to cumulative changes in the composition of native vegetation in the BG BGC Zone will occur during construction and intermittently but repeatedly during operations or maintenance activities.

- Reversibility: short to long-term – the regeneration period for native vegetation depends on the growth time required for species in each area. Weed introduction can take years of management to remediate, depending on the non-native species (*i.e.*, non-native grasses) and the specificity of the herbicide.

- Magnitude: medium –the Project will contribute to a combined loss or alteration of native grassland vegetation, however, there are no standards or thresholds that would otherwise indicate loss or alteration of native grassland vegetation is unacceptable. Best practices, objectives and provincial guidelines will be followed. Minimal indirect impacts to vegetation communities will be caused by the Project since the Project parallels existing linear features to the extent practical.

- Probability: high – it is likely that proposed clearing activities for the Project will combine with reasonably foreseeable developments and past clearing for existing activities to affect bunchgrass vegetation communities.

- Confidence: high – based on experience from past pipeline projects and the professional experience of the assessment team.

Project Contribution to Combined Incremental Increase in Alteration or Disturbance of Vegetation Communities of Concern

The following potential cumulative effects are likely to act in combination to result in overall effects on native vegetation:

- Project contribution to incremental increase in alteration or disturbance of native vegetation;

- Project contribution to incremental increase in alteration or disturbance of rare ecological communities; and

- Project contribution to incremental increase in alteration or disturbance of grassland communities in the BG BGC Zone.

The Project will contribute to a comparatively small loss or alteration of native vegetation (approximately 2,058 ha) when combined with existing activities (75,315 ha) plus reasonably foreseeable developments (approximately 568 ha for those for which spatial data could be located).

Alteration of remnant or previously unaffected rare ecological communities and grassland communities may primarily be attributed to construction of the Project acting cumulatively with reasonably foreseeable developments in areas of native vegetation. The Project is predicted to contribute the largest amount of clearing of native vegetation in the Vegetation RSA when compared with other reasonably foreseeable developments, including in the BG BGC Zone. Since rare ecological communities were observed in areas of native vegetation during 2013 surveys, the number of rare ecological communities affected by construction of the Project may be relatively more numerous than those potentially affected by reasonably foreseeable developments. Consequently, the number of rare ecological communities and grassland communities affected by the Project and reasonably foreseeable developments acting cumulatively may not be much greater than those predicted to be altered by the Project alone.

Standard industry practices will be applied by the Project in areas of native vegetation, including grasslands and rare ecological communities, to prevent the introduction and spread of weeds. Similar practices are anticipated for reasonably foreseeable developments, so no mitigation measures beyond the Project-specific mitigation already proposed in Section 7.2.9 and the Pipeline EPP (Volume 6B) are deemed to be warranted. The overall combined cumulative effects on vegetation communities of concern within the Vegetation RSA are considered to be of medium magnitude because combined cumulative effects are anticipated to be largely mitigated during construction and post-construction environmental monitoring.

While the Project's contribution to combined alteration and loss of native vegetation and rare ecological communities is considered to be comparatively limited in extent (3% of the native vegetation in the Vegetation RSA will be cleared due to the Project), this is considered to be of medium magnitude because some of these communities, such as grasslands and Red or Blue-listed communities, are of management concern and generally require site-specific mitigation. Depending on the development type and species affected, the Project's contribution to combined cumulative effects on vegetation communities of concern is considered to be reversible in the medium to long-term. The probability of the above-listed cumulative effects acting in combination is high (Table 8.8-4, point 1[d]). A summary of the rationale for all the significance criteria for the Project's contribution to combined cumulative effects on the vegetation communities of concern indicator is provided below.

- Spatial Boundary: Vegetation RSA – residual Project effects on native vegetation and ecological communities of concern could interact with reasonably foreseeable developments within the Vegetation RSA to cause a cumulative alteration to native vegetation and ecological communities in the RSA.
- Duration: short-term – the Project's contribution to cumulative changes to native vegetation composition and alteration of rare ecological communities would occur during the construction phase or be completed within any one year during the operations phase.
- Frequency: isolated to periodic – the Project's contribution to cumulative changes in the disturbance or alteration of native vegetation and rare ecological communities will occur during construction and intermittently but repeatedly during operations for maintenance activities.
- Reversibility: medium to long-term – depending on the associated land use and the growth time required for species in each affected area (*e.g.*, forb versus tree), it may take more than 10 years to return to existing conditions depending on the types of communities affected. The incremental effects of the proposed pump stations (*e.g.*, Black Pines) and power lines (*i.e.*, Black Pines, Kingsvale) on native vegetation and rare ecological communities are expected to be prolonged beyond the first year of the operations phase (*e.g.*, disturbances resulting from pump station expansions or power lines) or may extend for the life of the Project (*i.e.*, long-term).
- Magnitude: medium – the Project's contribution to cumulative changes in the disturbance or alteration of native vegetation and rare ecological communities are anticipated to be largely mitigated during construction and post-construction environmental monitoring. The Project is located adjacent to existing disturbances where practical and the construction of the Project will result in the clearing of approximately 2,058 ha of native vegetation, which is considered to be within environmental standards given that best practices, objectives and provincial guidelines are being followed.
- Probability: high – the proposed pipeline corridor encounters known locations of rare ecological communities, grasslands and native vegetation. No rare ecological communities were identified during the 2013 field surveys at pump stations or power lines, though these proposed activities encounter native vegetation. In addition, grasslands in the BG BGC Zone are not affected by any proposed pump stations or terminals associated with the Project. Reasonably foreseeable developments are located on native vegetation lands with the potential to support rare ecological communities, so the probability is high for the Project and reasonably foreseeable developments to act cumulatively to affect vegetation communities of concern.
- Confidence: high – based on experience from past pipeline projects and the professional experience of the assessment team.

8.8.3.2 Vegetation Indicator – Plant and Lichen Species of Concern

The following provides the evaluation of significance of potential residual effects on the plant and lichen species of concern indicator.

Project Contribution to Incremental Increase in Alteration or Disturbance of Rare Plant and Rare Lichen Populations, if Mitigation Does Not Completely Protect the Site

Most of the rare plant and rare lichen species with potential to occur in the Vegetation RSA are found on lands supporting native vegetation (see the Vegetation Technical Report of Volume 5C). Alteration or disturbance of native vegetation reduces the potential habitat for rare plant and lichen species of concern, therefore, effects to native vegetation also affect rare plant and lichen species of concern.

The desktop review conducted prior to the vegetation surveys identified several previously identified populations of rare plants within the Vegetation RSA. Areas of native vegetation with high potential to support rare plants or lichens are known to occur in the Vegetation RSA and a low number of records of previously identified rare plants or lichens in some areas of the RSA may be a result of low survey effort in the area rather than an actual lack of rare plant or lichen populations (ACIMS 2013, BC CDC 2012).

Rare plant surveys were conducted during the growing season in 2013 on lands where access was granted as a component of the vegetation surveys. Supplemental ground based rare plant surveys are planned to be conducted prior to construction in some areas with high potential habitat for rare plant or lichen species that were not surveyed in 2013, new lands as a result of reroutes, as well as in some areas where access was not available and sites where rare plant or lichen species need to be confirmed (see Section 9.0). In the event that additional rare plant or lichen populations are identified for the Project during supplemental surveys, mitigation will be determined using the Rare Ecological Community and Rare Plant Population Management Plan (Pipeline EPP of Volume 6B).

In addition to those populations of rare plants and rare lichens previously identified as occurring in the Vegetation RSA, vegetation surveys conducted for the Project documented 151 occurrences of ACIMS and BC CDC-listed rare plant and lichen species, including 10 liverwort populations (5 unique species), 2 moss species, 133 vascular plant populations (39 unique species) and 6 rare lichen populations (6 unique species) (see the Vegetation Technical Report of Volume 5C). Due to potential connectivity among populations associated with an Element Occurrence (see Section 7.2.9), alteration of known or previously unidentified populations of rare plants or lichens may affect the viability of other populations in the Vegetation RSA.

Increased distance of light penetration due to clearing associated with for the Project and reasonably foreseeable developments will result in an indirect alteration of native vegetation (*i.e.*, the native plant species making up the habitat for rare plant and lichen populations). If part of a treed community is cleared, the light penetrating to the understory will change the species composition along the edges of the community where clearing occurred. However, this effect will not substantially contribute to the cumulative effects on rare plant or lichen populations beyond the direct effects on these populations caused by the clearing of native vegetation. Additionally, during the course of reclamation for the Project and reasonably foreseeable developments, as revegetation progresses, light penetration will generally decrease over time.

Indirect alteration of rare plant or lichen populations adjacent to the Project and reasonably foreseeable developments may occur due to soil erosion and disruption of surface flow patterns. Since the areas with greatest erosion risk will be seeded with native species or an annual cover crop (or otherwise stabilized with mulch, straw, crimping), the indirect alteration of native vegetation (*i.e.*, the native species making up the habitat for rare plant and lichen populations) as a result of erosion will not measurably contribute to overall effects on rare plant or lichen populations.

During all phases of the Project and reasonably foreseeable developments, vehicle traffic may increase dust deposition onto native vegetation adjacent to the development area which could include rare lichen populations. During reclamation and operations, dust due to development traffic could also result in minor cumulative effects to rare lichens located adjacent to the right-of-way.

With proper implementation of the industry-accepted standard mitigation practices, disruption of surface flow patterns and light levels following construction or maintenance activities is expected to be minor for the Project and reasonably foreseeable developments. However, construction activities may contribute to some localized alteration of light levels and natural surface drainage patterns until settlement is complete and seeded vegetation has matured.

Some lichens are found only in very specific habitats, living within a very narrow range of humidity, light and moisture regimes. For example, soil crust lichens may be sensitive to changes in moisture regimes, drainage patterns or erosion. Another example is arboreal lichens which may be sensitive to humidity and air flow patterns, which are affected by clearing in forested areas. If a lichen species only grows on trees, then any effect of the Project or reasonably foreseeable developments on trees or forested areas will in turn affect these lichen species.

Combined ground disturbance from the Project and reasonably foreseeable developments (as identified in Table 8.8-1) will act cumulatively with existing activities to affect rare plant and lichen populations in the Vegetation RSA.

Lands within the Vegetation RSA include approximately 127,407 ha (63%) of native vegetation, while the remaining areas have previously been converted to non-native cover types that provide little to no habitat value for rare plants and rare lichens. Loss or alteration of native vegetation attributed to existing activities associated with land use change (*i.e.*, agricultural activities, rural and urban residential development) precludes the ability to determine the extent to which previously existing or remnant populations of rare plants and rare lichens in the Vegetation RSA have been altered. However, the potential for rare plant and rare lichen populations is highest on lands supporting native vegetation and, therefore, construction activities for the Project and reasonably foreseeable developments may act cumulatively to alter remaining or previously unaffected rare plant and lichen populations in the Vegetation RSA. Details of reasonably foreseeable developments that may act cumulatively with construction of the proposed pipeline and facilities are provided in Section 8.1.4 and Tables 8A.1-1 through 8A.1-6 of Appendix 8.1.

The presence and abundance of rare plant and lichen populations along the proposed pipeline corridor were assessed during early and late-season rare plant surveys in 2013 (see the Vegetation Technical Report of Volume 5C). Implementation of site and species-specific mitigation measures outlined in Section 7.2.9 and the Pipeline EPP of Volume 6B is expected to reduce the magnitude and shorten the period of reversibility for residual effects to known rare plant populations. Mitigation measures that were implemented during construction of other major pipeline projects including the TMX Anchor Loop Project are similar to those that have been recommended for construction of this Project. Additionally, disturbed areas supporting native vegetation or wetlands will be left to naturally regenerate or will be seeded with an appropriate native seed mixture. Due to the size and scope of reasonably foreseeable developments in the Vegetation RSA, it is anticipated that implemented site and species-specific mitigation measures for potentially affected rare plant and rare lichen populations will be similar to those recommended for the Project. Consequently, the number of rare plant and rare lichen populations affected by the Project and reasonably foreseeable developments acting cumulatively may not be much greater than those predicted to be altered by the Project alone. Specifically, the Project is predicted to contribute to 78% of the projected total new disturbance to native vegetation (which provides habitat for rare plant and lichen species). For any rare plant or rare lichen populations identified for the Project during future rare plant surveys (see Section 9.0), appropriate site-specific protection measures outlined in the Plant Species and Ecological Communities of Concern Discovery Contingency Plan (Pipeline EPP of Volume 6B) will be implemented. The appropriate mitigation will be selected so that the rare plant and lichen populations, particularly S1 species if identified, are not placed at risk. To this end, Trans Mountain will report any rare plants or rare lichens identified to the provincial conservation data centre (*i.e.*, BC CDC or ACIMS). No additional mitigation measures beyond the Project-specific mitigation already proposed in Section 7.2.9 and the Pipeline EPP of Volume 6B are deemed warranted.

Given that indirect effects are, in part, caused by disturbance to vegetation structure associated with clearing activities, allowing disturbed areas to naturally revegetate may not alleviate indirect effects where vegetation management is conducted or long-term persistence of the disturbance exists. Consequently, cumulative effects resulting from indirect effects to vegetation are expected to persist until the pre-existing vegetation composition and structure is restored. The overall cumulative effects on plant and lichen species of concern within the Vegetation RSA are considered to be of medium magnitude because combined cumulative effects are anticipated to be largely mitigated during construction and post-construction environmental monitoring.

The Project's contribution to cumulative effects on rare plant and rare lichen populations is considered to be reversible in the medium to long-term, depending on the species affected and of medium magnitude (Table 8.8-4, point 2[a]). A summary of the rationale for all the significance criteria for the Project's contribution to combined cumulative effects on the plant and lichen species of concern indicator is provided below.

- Spatial Boundary: Vegetation RSA – Project effects on rare plant and rare lichen populations could interact with reasonably foreseeable developments within the Vegetation RSA to cause a cumulative alteration to rare plant and lichen populations in the RSA.
- Duration: short-term – the Project's contribution to cumulative alteration of rare plant or lichen populations would occur during the construction phase or be completed within any one year during the operations phase.
- Frequency: isolated to periodic – the Project's contribution to cumulative changes in the disturbance or alteration of rare plant or lichen populations will occur during construction and intermittently but repeatedly during operations for maintenance activities.
- Reversibility: medium to long-term – depending on the lichen or plant species (*e.g.*, forb vs. tree), and associated land use. It may take more than one year plus adequate precipitation levels in order for the trench crown to settle and natural drainage patterns to be restored, and it will take several years for vegetation to grow back to former heights, which will prevent increased light from reaching surrounding rare plant and rare lichen populations. Based on post-construction environmental monitoring results from the TMX Anchor Loop Project, effects on rare plants and lichens were generally resolved in three to five years (*i.e.*, it was obvious in three to five years of post-construction environmental monitoring whether the population would recover or die) (TERA 2011c). However, effects from facilities and pump stations may result in a somewhat extended period of reversibility.
- Magnitude: medium – the Project's contribution to cumulative effects on rare plant or lichen species of concern is of medium magnitude since established regulatory standards typically require additional mitigation like those proposed for the Project to avoid unacceptable effects and reduce potential cumulative effects.
- Probability: high – the proposed pipeline corridor crosses 151 known occurrences of rare plant and lichen populations, and some of the reasonably foreseeable developments are predicted to be in areas of native vegetation with potential to support rare plant and rare lichen populations.
- Confidence: high – based on past pipeline projects, the professional experience of the assessment team and the results of post-construction environmental monitoring of past pipeline projects under similar conditions.

8.8.3.3 Vegetation Indicator – Presence of Infestations of Provincial Weed Species and Other Invasive Non-Native Species Identified as a Concern

The following provides the evaluation of significance of potential residual effects on the presence of infestations of provincial weed species and other invasive non-native species identified as a concern indicator.

<u>Project Contribution to Weed Introduction or Spread</u>

Weeds typically establish in areas that have been previously disturbed. Existing activities resulting in ground disturbance that contributes to introduction and spread of weeds include agriculture and livestock grazing, forestry, recreation, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development and mineral resource exploration and development. Since construction activities for the Project and reasonably foreseeable developments will require ground disturbance they could act cumulatively to cause weed introduction and spread within the Vegetation RSA. For example, the Parkland Airport (Phase 1) is predicted to be constructed on agricultural lands adjacent to the Project near Edmonton, Alberta and may contribute to weed introduction and spread within the Vegetation RSA.

Given the mitigation measures that will be implemented to control weed introduction and spread during both construction and operation of the Project, it is expected that the Project would contribute less to the introduction and spread of weeds when compared to existing activities (*e.g.*, agriculture, highway developments) within the Vegetation RSA.

Vegetation surveys conducted in 2013 included incidental weed observations in areas of native vegetation selected for survey (see the Vegetation Technical Report of Volume 5C). The proposed weed-related mitigation outlined in Section 7.2.9 and in the Pipeline EPP of Volume 6B will reduce the potential for cumulative effects. Weed presence and abundance on the Footprint will be assessed during a pre-construction weed survey in 2015. Other developers within the Vegetation RSA are expected to implement similar industry standard mitigation to control weeds (*e.g.*, AENV 2003, BC OGC 2010, Government of Alberta 2011, 2013b). Further to this, it is anticipated that best management practices will be implemented by many farmers, ranchers, forestry companies and municipal areas to reduce introduction of weeds associated with anthropogenic activities within the Vegetation RSA. No additional weed mitigation beyond the Project-specific mitigation already proposed in Section 7.2.9 and the Pipeline EPP of Volume 6B is deemed to be warranted. The overall cumulative effect on weeds and other invasive non-native species of concern within the Vegetation RSA is considered to be of low to medium magnitude because combined cumulative effects are anticipated to be largely mitigated during construction and post-construction environmental monitoring.

The Project's contribution to cumulative effects on weed introduction and spread within the Vegetation RSA is reversible in the short to medium-term depending on the species and the size of the infestation and of low to medium magnitude (Table 8.8-4, point 3[a]). A summary of the rationale for all the significance criteria of the Project's contribution to cumulative effects on weeds and other invasive non-native species of concern is provided below.

- Spatial Boundary: Vegetation RSA – residual Project effects on weed introduction and spread could interact with reasonably foreseeable developments within the Vegetation RSA to cause an incremental increase in weed distribution and abundance in the RSA.
- Duration: short-term – the Project's contribution to cumulative spread or introduction of weed species would occur during the construction phase or be completed within any one year during the operations phase.
- Frequency: isolated to periodic – the Project's contribution to cumulative weed introduction and spread will occur during construction and intermittently but repeatedly during operations for maintenance activities.
- Reversibility: short to medium-term – depending on the species, associated land use and the density/distribution of the occurrence.
- Magnitude: low to medium – the Project's contribution to combined weed introduction or spread is of low to medium magnitude since established regulatory standards typically require additional mitigation like those proposed for the Project to avoid unacceptable effects.
- Probability: high – weeds and invasive, non-native species are known to occur along the proposed pipeline corridor and likely to occur throughout the Vegetation RSA.
- Confidence: high – based on past pipeline projects and the professional experience of the assessment team.

8.8.3.4 Project Contribution to Combined Cumulative Effects on Vegetation

A number of potential effects (*i.e.*, Project contribution to combined incremental increase in alteration or disturbance of native vegetation, grasslands and rare ecological communities, incremental increase in alteration or disturbance of rare plant and rare lichen populations and weed introduction and spread) contribute to cumulative effects on vegetation in the Vegetation RSA, as described above for vegetation communities and populations of rare species.

The implementation of mitigation measures recommended in Section 7.2.9 and the Pipeline and Facilities EPPs (Volumes 6B and 6C) will reduce the severity of cumulative effects arising from the Project. It is anticipated that many operators of other reasonably foreseeable developments would implement similar mitigation according to industry standards and provincial regulatory guidelines.

The Project's contribution to cumulative effects on the vegetation indicators is of low to medium magnitude, reversible in the short to long-term and of high probability (Table 8.8-4, point 4[a]). A summary of the rationale for all the significance criteria of the Project's contribution to cumulative effects on the vegetation indicators is provided below.

- Spatial Boundary: Vegetation RSA – the Project's contribution to combined cumulative effects on vegetation may interact with reasonably foreseeable developments within the Vegetation RSA to cause a cumulative effect on vegetation resources in the RSA.
- Duration: short-term – the Project's contribution to combined cumulative effects on vegetation would occur during the construction phase or be completed within any one year during the operation phase.
- Frequency: isolated to periodic – the Project's contribution to combined cumulative effects on vegetation will occur during construction and intermittently but repeatedly during operations for maintenance activities.
- Reversibility: short to long-term – depending on the species, the pre-existing vegetation community (*e.g.*, grasses and shrubs regenerate within several years, however, tree canopy regrowth is expected to extend into the long-term) and the type of activity (*i.e.*, temporary facility, power line, pump station).
- Magnitude: low to medium – the Project's contribution to combined cumulative effects on vegetation is considered to be within environmental standards given the implementation of industry standard guidelines and federal and provincial recommended mitigation.
- Probability: high – it is likely that these cumulative combined effects will occur.
- Confidence: high – based on experience from past pipeline projects and the professional experience of the assessment team.

8.8.4 Summary

As identified in Table 8.8-4, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on vegetation within the Vegetation RSA will be not significant.

8.9 Wildlife and Wildlife Habitat

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to contribute to cumulative effects on wildlife and wildlife habitat indicators that were anticipated to have an adverse combined Project-specific residual effect (*i.e.*, mammal, bird, and amphibian and reptile indicators).

Relevant regulatory guidelines, ATK, TEK, ecological context and residual Project effects were considered in the characterization of potential cumulative effects for wildlife and wildlife habitat indicators. TEK participants identified the potential long-term and cumulative effects of pipeline construction on wildlife as a concern. Additional information on wildlife TEK collected during field studies for the Project is provided in the Wildlife Technical Report of Volume 5C.

8.9.1 Reasonably Foreseeable Developments

Inclusion lists of the reasonably foreseeable developments located within the Wildlife RSA, Caribou RSA and Grizzly Bear RSA are provided in Appendix 8.1 (Tables 8A.1-1 to 8A.1-4), and Figures 8.1-1a to 8.1-1c. Developments with spatial information (Tables 8A.1-1 to 8A.1-4) were considered quantitatively in the evaluation of cumulative effects on the wildlife indicators.

As indicated in Section 8.1, additional reasonably foreseeable developments with the potential to act in combination with the Project were excluded from quantitative evaluations where development details (*e.g.*, approval status, location) were either lacking or the development is planned within previously disturbed areas of municipal boundaries, such as the City of Edmonton and LMDA. Descriptions of these developments are provided in Section 8.1.4 and Appendix 8.1 (Tables 8A.1-5 and 8A.1-6). These developments were considered qualitatively, where relevant, in the assessment of cumulative effects on wildlife and wildlife habitat.

The current level of disturbance due to existing activities within the Wildlife RSA, as well as the predicted disturbance attributed to the Project and reasonably foreseeable developments is summarized in Tables 8.9-1 (Alberta) and 8.9-2 (BC). The Project Footprint used in the quantitative analysis is defined in Section 7.2.10.2. A hierarchy table was applied to quantitative analyses to determine priority of overlapping land use features (*i.e.*, features with greater indirect footprint and assumed effects potential are assigned higher priority); thereby avoiding double-counting of overlapping disturbances.

TABLE 8.9-1

EXISTING AND NEW AREAL DISTURBANCE IN THE WILDLIFE REGIONAL STUDY AREA IN ALBERTA

Land Use Feature	Existing Areal Disturbance (ha)	New Areal Disturbance (ha)			Total Areal Disturbance (ha)
		Proposed Project	Other Activities	Total	
Cities/Towns/Communities	96,328.1	--	--	--	96,328.1

Percent of Wildlife RSA Disturbed	31.66	0.08	4.04	4.12	35.77

Note: 1 Spatial data for future cutblocks was not available at the time of assessment. The area of future forest harvest in the Wildlife RSA was estimated based on available annual harvest information (*e.g.*, annual allowable cut) and projected to the end of 2017 (anticipated in-service date of the Project).

The Project is likely to interact with the existing and reasonably foreseeable developments to contribute to cumulative effects on wildlife and wildlife habitat through all three identified effects pathways: changes in habitat (Section 8.9.2); changes in movement (Section 8.9.3); and increased mortality risk (Section 8.9.4).

8.9.2 Cumulative Changes in Habitat

Habitat loss or alteration resulting from natural disturbances, existing activities and reasonably foreseeable developments will act cumulatively with the Project to affect wildlife habitat. Existing activities and reasonably foreseeable developments also have or will alter wildlife habitat by changing or removing vegetation. In addition to anthropogenic disturbance, natural disturbance was considered in the evaluation of cumulative habitat change in the Wildlife RSA. Wildfires alter wildlife habitat by interrupting successional sequences and producing landscape-level mosaics in forest maturity that include regenerating, immature and late successional stands (*i.e.*, mature and old forest) (Johnson *et al.* 1995). Abundance and species composition of wildlife communities change post-wildfire in response to the succession of vegetation from early initiation stages, through establishment and intermediate stages into mature and old forests (Fisher and Wilkinson 2005, Hobson and Schieck 1999). Approximately 33,717 ha (1.1%) of the Wildlife RSA has been altered by forest fires that have burned in the last 40 years. Natural fire patterns have been substantially modified in the Wildlife RSA as a result of fire suppression and vegetation modification (*e.g.*, agriculture, developed lands). Most of the fires occurred in the Black Pines to Hope Segment (over 100 documented fires with an average size and standard deviation of 234.4 ha ± 1,088.2 ha). A notable number of fires also occurred in the Edmonton to Hinton and Hargreaves to Darfield segments (over 70 fires in each with an average size and standard deviation of 324.6 ha ± 1,145.0 ha and 119.4 ha ± 303.3 ha, respectively). Fire was less common in the Hinton to Hargreaves, Darfield to Black Pines, Hope to Sumas and Sumas to Burnaby segments (*i.e.*, less than 15 fires in each); this is to be expected given the relative abundance of agricultural and developed land, as well as the naturally lower fire interval of the wetter coastal region (compared to dry interior regions) in these segments.

In most cases, endemic biotic disturbance (*e.g.*, biotic and abiotic forest health factors) is a natural ecosystem process; however, human activity can interfere with these processes to potentially cause unnatural disturbance events and exacerbate the issue (Managed Forest Areas and Forest Health Technical Report of Volume 5C). The mountain pine beetle infestation has caused substantial natural disturbance in some areas of BC. The clearings and roads associated with salvage harvest of pine beetle infested stands have contributed further to cumulative effects on wildlife and wildlife habitat. The quantitative analysis of habitat change and disturbance in the Wildlife RSA incorporates changes associated with fire, mountain pine beetle, forest harvest and roads to the extent possible with the available regional habitat and disturbance data.

A critical threshold for habitat loss may be defined as an abrupt, non-linear change that occurs in some parameter (*e.g.*, behaviour, abundance, community composition) across a small range of habitat loss (Swift and Hannon 2010) (*e.g.*, the abundance of a species in a landscape declines more or less linearly as suitable habitat is lost, but may decline more rapidly once the amount of remaining habitat in the landscape falls below a certain proportion of the total landscape area). Critical threshold relationships between habitat loss and various ecological responses have been suggested in numerous simulation models and, to a lesser degree, empirical landscape-scale studies (Swift and Hannon 2010). Although highly variable, depending on species or landscape characteristics or other conditions, most of the observed critical thresholds for cumulative habitat loss occur between 10% and 50% of remaining habitat (*i.e.*, when 50% to 90% of suitable habitat has been lost) (Swift and Hannon 2010). The available scientific literature indicates that cumulative effects risk is highest when total habitat loss measured at the landscape (*i.e.*, regional) scale is high (> 70%), as discussed in more detail below.

Habitat loss or alteration by both the Project and existing activities and reasonably foreseeable developments may act cumulatively to cause habitat fragmentation. Habitat fragmentation results when complete or partial barriers to movement cause functional separation of habitats into smaller, isolated habitat patches (Andrén 1994, Jalkotzy *et al.* 1997). The three main components of habitat fragmentation are habitat loss, reduced habitat patch size and increased isolation of patches (Andrén 1994). Habitat fragmentation has the potential to alter species abundance and distribution over the landscape by affecting predation and brood parasitism, altering microclimate, decreasing food, and reducing ability of animals to move between habitat patches within a landscape (Swift and Hannon 2010). Species that have late age of first reproduction, low population densities, low reproductive rates, large home-ranges, low fecundity, and move over large distances to disperse, find food and mate, display low resilience to habitat fragmentation (Dunne and Quinn 2009).

Several studies suggest that cumulative effects risk and the influence of patch size and spatial arrangement is highest when habitat loss measured at the landscape (*i.e.*, regional) scale is high (> 70%). For example, a modelling-based study by Flather and Bevers (2002) concluded that the amount of habitat accounted for > 96% of total variation in wildlife abundance compared to < 1% for arrangement of habitat, over a broad range of habitat types and arrangements. They also concluded that when total habitat loss was less than 50-70%, the effects were simply habitat loss effects; with higher total loss, habitat arrangement effects became more important. These findings are consistent with conclusions from other meta-analyses and modeling studies (Andrén 1994, Fahrig 1997, Forman and Collinge 1997, Rich *et al.* 1994, Schmiegelow and Mönkkönen 2002, Swift and Hannon 2010). Andrén (1994) suggests that in landscapes with more than 30% of suitable habitat remaining (*i.e.*, less than 70% of suitable habitat is disturbed), the total area of suitable habitat is of greater importance than its spatial arrangement (*e.g.*, patch size and isolation). As habitat loss increases, the remaining habitat becomes increasingly fragmented or the habitat patches are increasingly isolated, which may compound the effects of habitat loss (Swift and Hannon 2010). The proportion of the Wildlife RSA in Alberta that is disturbed is predicted to increase from 50.3% under existing conditions to 52.7% with the Project and foreseeable future developments (Table 8.9-1). In the Wildlife RSA in BC, the proportionate disturbance increases from 31.7% under existing conditions, to 35.8% with the Project and foreseeable future developments (Table 8.9-2). In some areas of the Wildlife RSA such as the LMDA, the existing cumulative disturbance level is high, and fragmentation effects can be expected. However, based on the above research findings, this level of cumulative disturbance suggests that the cumulative effects risk is likely moderate at the scale of the Wildlife RSA, and substantial fragmentation (*i.e.*, habitat spatial arrangement) effects are not anticipated.

The predicted change in wildlife habitat types from existing conditions to future conditions (*i.e.*, cumulative scenario) is summarized in Tables 8.9-3 (Alberta) and 8.9-4 (BC). Ecosystem units for the RSA in Alberta were based on the Alberta Ground Cover Classification (AGCC) data (ASRD 2010). AGCC land cover classes were combined into ecologically relevant higher order groupings (“habitat types”) to simplify the analysis and increase accuracy. Ecosystem units in BC were derived from the Broad Ecosystem Inventory (BEI) data (BC MOE 2003). The BEI provides mapping of broad ecosystem units (BEUs), which describe the vegetation communities that a given location can support based on geological or climatic conditions. BEUs have been used previously by government-supported projects in BC to evaluate wildlife habitat, and are included as a component of the provincial wildlife accounts (BC Ministry of Water, Lands and Air Protection [MWLAP] 2004), which facilitates determining the BEUs that are likely to represent suitable habitat for a given species. The predicted change in habitat from existing to cumulative future conditions was estimated by incorporating updated disturbance information for existing activities, the Project, and reasonably foreseeable developments into the available regional-scale habitat data (AGCC in Alberta, BEI in BC).

Tables 8.9-3 and 8.9-4 summarize the predicted changes in habitat from existing conditions to Project and cumulative conditions within the Wildlife RSA. For ease of description, anthropogenic disturbance is grouped into broad categories: agriculture, cutblock, vegetated linear anthropogenic (defined to include linear disturbances that are typically reclaimed to a vegetated state, such as pipeline, power line and utility rights-of-way, and seismic lines), and other anthropogenic disturbance (includes the remaining disturbance types such as urban, industrial, commercial and transportation developments). Detailed disturbance information is provided in Tables 8.9-1 and 8.9-2. Figures 8.9-1 and 8.9-2 illustrate the relative proportion of each habitat type within the Natural Subregions (Alberta) and Ecoprovinces (BC) in the Wildlife RSA, and the predicted change from existing conditions to Project and cumulative conditions. Disturbance in the Wildlife RSA in Alberta is primarily associated with agriculture. Cutblocks and other anthropogenic disturbance (mostly urban and transportation development) are the primary disturbance types in the Wildlife RSA in BC.

TABLE 8.9-3

PREDICTED HABITAT CHANGE IN THE WILDLIFE REGIONAL STUDY AREA IN ALBERTA

Habitat Type	Ecosystem Unit[1]	Existing Condition	Project Condition[2]		Cumulative Condition[3]

Notes:
1. Ecosystem units are derived from BEUs, using BEI data (BC MOE 2003). Disturbance units are incorporated using disturbance data compiled for the Project.
2. Project Condition includes existing activities (with available spatial data) + Project.
3. Cumulative Condition includes existing activities + Project + reasonably foreseeable developments (with available spatial data).
4. Percent change is calculated as the change from existing conditions. ↓ represents a decrease and ↑ represents an increase.

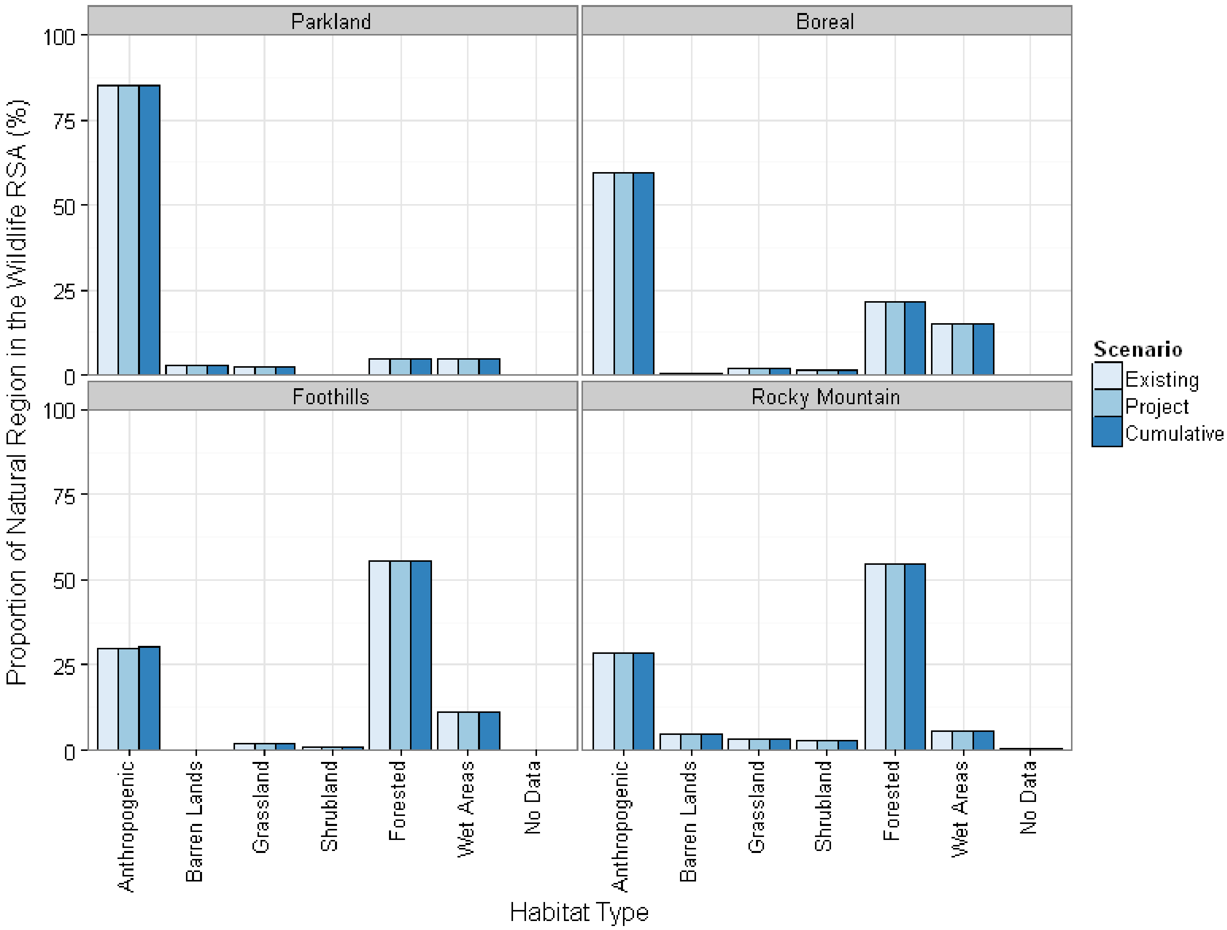

Figure 8.9-1 Predicted Change in Habitat Types in the Wildlife RSA in Alberta
Change in habitat types is presented as the proportion of the Natural Region within the Wildlife RSA represented by each habitat type at existing, Project and cumulative conditions. The ecosystem units that comprise the habitat types are presented in Table 8.9-3.

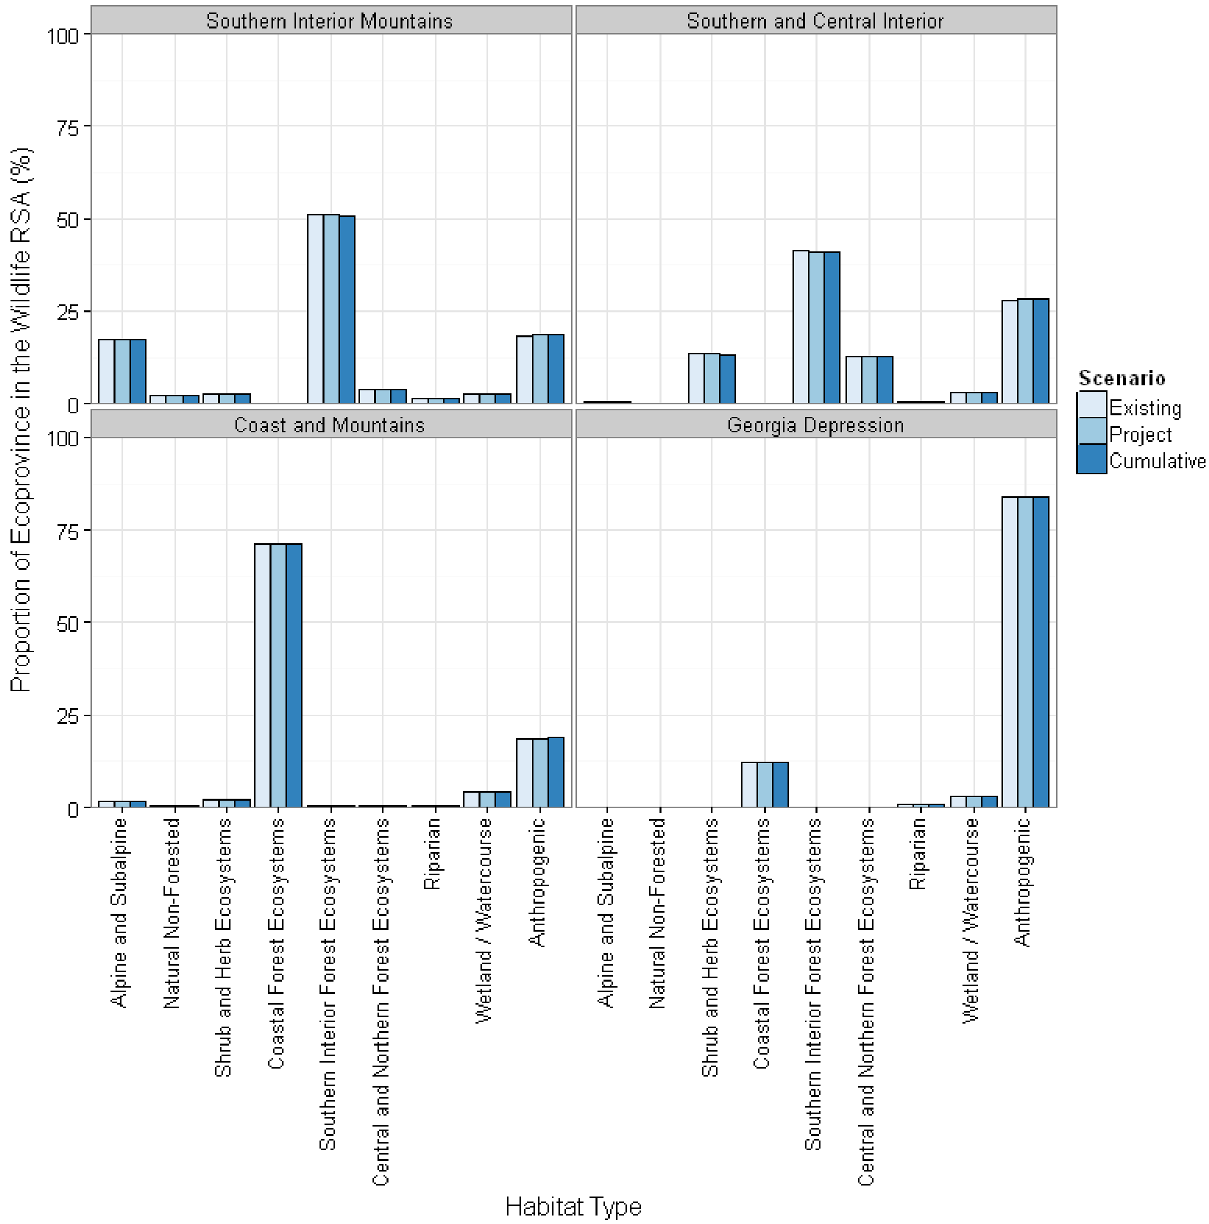

Figure 8.9-2 Predicted Change in Habitat Types in the Wildlife RSA in BC
Change in habitat types is presented as the proportion of the Ecoprovince within the Wildlife RSA represented by each habitat type at existing, Project and cumulative conditions. The ecosystem units that comprise the habitat types are presented in Table 8.9-4.

8.9.3 Cumulative Changes in Wildlife Movement

The Project may contribute to cumulative effects in combination with existing activities and reasonably foreseeable developments to increase filters or barriers (partial or complete barriers respectively) to movement for some wildlife species. Wildlife movement patterns vary between species, with species-specific attributes such as size and life stage, and other factors such as time of day and season. Many species alter their movements to avoid areas with high levels of human activity and development. However, some species may be less affected by, or are attracted to, anthropogenic disturbance and habitually use established trails for movement, regardless of proximity to human activity and development. In some cases, linear developments have been shown to block, delay or deflect ungulate movements, potentially restricting or reducing access to some parts of their range (Harper *et al.* 2001). Studies on small mammal movements in forested habitat have concluded that pipeline rights-of-way may act as barriers or filters to movement of flying squirrels, red squirrels and marten (Marklevitz 2003). Changes in movement patterns can also occur since some wildlife species may be attracted to linear corridors as travel routes. For example, wolverines have been found to diverge from their line of travel under forest cover when linear corridors with compacted snow were encountered, in order to follow the linear corridors, which provided easier travel routes (Wright and Ernst 2004). Changes in movement patterns may also occur as some species are attracted to early seral vegetation in regenerating areas. Species that prefer edges and habitat generalists are most likely to use disturbed areas (Jalkotzy *et al.* 1997). Sensory disturbance of wildlife resulting from Project construction activities may also act cumulatively with existing sources of auditory and visual disturbances, such as industrial development and traffic, to cause wildlife to alter their movement patterns (*i.e.*, reduced use or avoidance).

8.9.4 Cumulative Risk of Wildlife Mortality

Wildlife mortality risk may increase due to the cumulative effects of the Project, existing activities (*e.g.*, recreational and subsistence hunting and trapping, traffic) and reasonably foreseeable developments. Increased mortality risk may result from habitat disturbance (*e.g.*, clearing and soil handling has potential to disturb active nests, dens, hibernacula, overwintering sites), sensory disturbance, vehicle/wildlife collisions, and increased predation, hunting or trapping as a result of increased access or habitat alteration. Trapping, hunting and poaching are often associated with roads or other linear corridors that create access (Collister *et al.* 2003, Wiacek *et al.* 2002). Linear corridors can also increase the risk of mortality for some species by attracting prey species to early seral vegetation establishing on the disturbance, where the improved access and increased sight-lines may lead to increased predator efficiency. Linear corridors are attractive to predators as easy travel routes (James 1999, Stuart-Smith *et al.* 1997, Thurber *et al.* 1994) and may affect predator-prey dynamics (Bergerud *et al.* 1984, Edmonds and Bloomfield 1984, Rohner and Kuzyk 2000).

8.9.5 Potential Cumulative Effects on Wildlife and Wildlife Habitat Indicators

The potential and likely residual effects associated with the construction and operation of the Project on wildlife indicators were identified in Section 7.2.10.7 and are listed in Table 8.9-5, along with existing activities and reasonably foreseeable developments that could act in combination with the Project.

TABLE 8.9-5

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON WILDLIFE AND WILDLIFE HABITAT CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Combined Project effects on grizzly bear resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Grizzly Bear RSA	Edmonton to Hinton Segment Hargreaves to Darfield Segment Black Pines to Hope Segment Temporary Facilities	Construction to Operations	Project contribution to cumulative effects on grizzly bear.	• Existing activities/disturbance including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure, hunting/trapping. • Reasonably foreseeable developments within the Grizzly Bear RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, topsoil/root zone material salvage, grading, trenching, blasting, materials storage, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
2. Combined Project effects on woodland caribou resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Caribou RSA	Hargreaves to Darfield Segment Temporary Facilities	Construction to Operations	Project contribution to cumulative effects on woodland caribou.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 and 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, topsoil/root zone material salvage, grading, trenching, blasting, materials storage, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
3. Combined Project effects on moose resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	Edmonton to Hinton Segment Hargreaves to Darfield Segment Black Pines to Hope Segment Temporary Facilities Pump Stations (Black Pines Pump Station and power line, Kingsvale Pump Station and power line)	Construction to Operations	Project contribution to cumulative effects on moose.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure, hunting. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, topsoil/root zone material salvage, grading, trenching, blasting, materials storage, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).

TABLE 8.9-5 Cont'd

Potential Residual Project Effect on Indicator	Spatial Boundary	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
4. Combined Project effects on forest furbearers resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	Edmonton to Hinton Segment Hargreaves to Darfield Segment Black Pines to Hope Segment Hope to Burnaby Segment Temporary Facilities Pump Stations (Black Pines Pump Station and power line, Kingsvale Pump Station and power line)	Construction to Operations	Project contribution to cumulative effects on forest furbearers.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure, trapping. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, topsoil/root zone material salvage, grading, trenching, blasting, materials storage, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
5. Combined Project effects on coastal riparian small mammals resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	Black Pines to Hope Segment Hope to Burnaby Segment Burnaby to Westridge Segment Temporary Facilities Tanks (Sumas) Westridge Marine Terminal	Construction to Operations	Project contribution to cumulative effects on coastal riparian small mammals.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 and 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, topsoil/root zone material salvage, grading, trenching, blasting, materials storage, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
6. Combined Project effects on bats resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	All Components	Construction to Operations	Project contribution to cumulative effects on bats.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).

TABLE 8.9-5 Cont'd

Potential Residual Project Effect on Indicator	Spatial Boundary	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
7. Combined Project effects on grassland/ shrub-steppe birds resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	Hargreaves to Darfield Segment Black Pines to Hope Segment Temporary Facilities Pump Stations (Black Pines Pump Station and power line)	Construction to Operations	Project contribution to cumulative effects on grassland/shrub-steppe birds.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
8. Combined Project effects on mature/old forest birds resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	All Components	Construction to Operations	Project contribution to cumulative effects on mature/old forest birds.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
9. Combined Project effects on early seral forest birds resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	All Components	Construction to Operations	Project contribution to cumulative effects on early seral forest birds.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).

TABLE 8.9-5 Cont'd

Potential Residual Project Effect on Indicator	Spatial Boundary	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
10. Combined Project effects on riparian and wetland birds resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	All Components	Construction to Operations	Project contribution to cumulative effects on riparian and wetland birds.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
11. Combined Project effects on wood warblers resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	Edmonton to Hinton Segment Temporary Facilities	Construction to Operations	Project contribution to cumulative effects on wood warblers.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-5 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
12. Combined Project effects on short-eared owl resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	Edmonton to Hinton Segment Hargreaves to Darfield Segment Black Pines to Hope Segment Hope to Burnaby Segment Burnaby to Westridge Segment Temporary Facilities Pump Stations (Black Pines Pump Station and power line)	Construction to Operations	Project contribution to cumulative effects on short-eared owl.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).

TABLE 8.9-5 Cont'd

Potential Residual Project Effect on Indicator	Spatial Boundary	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
13. Combined Project effects on rusty blackbird resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	Edmonton to Hinton Segment Hargreaves to Darfield Segment Black Pines to Hope Segment Hope to Burnaby Segment Temporary Facilities Pump Stations (Black Pines Pump Station and power line, Kingsvale Pump Station and power line)	Construction to Operations	Project contribution to cumulative effects on rusty blackbird.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 to 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
14. Combined Project effects on flammulated owl resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	Black Pines to Hope Segment Temporary Facilities Pump Stations (Black Pines Pump Station and power line, Kingsvale Pump Station and power line)	Construction to Operations	Project contribution to cumulative effects on flammulated owl.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 and 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).
15. Combined Project effects on Lewis's woodpecker resulting from habitat loss or alteration, changes in movement and increased mortality risk.	Wildlife RSA	Black Pines to Hope Segment Temporary facilities Pump Stations (Black Pines Pump Station and power line, Kingsvale Pump Station and power line)	Construction to Operations	Project contribution to cumulative effects on Lewis's woodpecker.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 and 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, blasting, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).

Wildlife RSA	Black Pines to Hope Segment Temporary Facilities	Construction to Operations	Project contribution to cumulative effects on arid habitat snakes.	• Existing activities including natural disturbance, settlement, agriculture and livestock grazing, natural resource extraction (*i.e.*, forestry, oil and gas, mineral), recreation and tourism, rural and urban development, transportation and infrastructure. • Reasonably foreseeable developments within the RSA listed in Tables 8A.1-1 and 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities include clearing, topsoil/root zone material salvage, grading, trenching, blasting, materials storage, installation of Project components, camps, temporary access, construction traffic, reclamation, operational activities (vegetation control, access, traffic, human activity, monitoring and maintenance).

8.9.6 Significance Evaluation of Potential Cumulative Effects on Mammals

The Project is likely to interact with existing and reasonably foreseeable disturbances to have an incremental cumulative effect on habitat, movement and mortality risk of mammals within the Grizzly Bear, Caribou and Wildlife RSAs. Table 8.9-6 provides a summary of the significance evaluation of the Project's contribution to cumulative effects on mammal indicators. The assessment rationale is provided below.

TABLE 8.9-6

SUMMARY OF SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON MAMMAL INDICATORS

	Potential Cumulative Effects	Impact Balance	Spatial Boundary	Temporal Context			Magnitude	Probability	Confidence	Significance[1]
				Duration	Frequency	Reversibility				
1.	Wildlife Indicator – Grizzly Bear									
1(a)	Project contribution to cumulative effects on grizzly bear.	Negative	Grizzly RSA	Short-term	Periodic	Long-term	Medium	High	Moderate	Not significant
2.	Wildlife Indicator – Woodland Caribou									
2(a)	Project contribution to cumulative effects on woodland caribou.	Negative	Caribou RSA	Short-term	Periodic	Long-term	Medium	High	Moderate	Not significant
3.	Wildlife Indicator – Moose									
3(a)	Project contribution to cumulative effects on moose.	Negative	Wildlife RSA	Short-term	Periodic	Long-term	Low	High	Moderate	Not significant
4.	Wildlife Indicator – Forest Furbearers									
4(a)	Project contribution to cumulative effects on forest furbearers.	Negative	Wildlife RSA	Short-term	Periodic	Long-term	Low	High	Moderate	Not significant
5.	Wildlife Indicator – Coastal Riparian Small Mammals									
5(a)	Project contribution to cumulative effects on coastal riparian small mammals.	Negative	Wildlife RSA	Short-term	Periodic	Long-term	Medium	High	Low	Not significant
6.	Wildlife Indicator – Bats									
6(a)	Project contribution to cumulative effects on bats.	Negative	Wildlife RSA	Short-term	Periodic	Long-term	Low	High	Low	Not significant

Note: 1 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.9.6.1 Cumulative Change in Habitat for Mammal Indicators

The Project will contribute to combined loss or alteration of mammal habitat resulting from natural disturbance, existing activities and foreseeable future disturbances. Table 8.9-7 and Figure 8.9-3 summarize the predicted changes in availability of potential habitat for mammal indicators as a result of combined disturbance from the Project and reasonably foreseeable developments within the Wildlife RSA.

TABLE 8.9-7

Notes: 1 Quantitative analyses for grizzly bear and caribou habitat change were completed with different methods. Results are provided in Tables 8.9-8 and 8.9-9.

2 Refer to the Wildlife Modelling and Species Accounts Technical Report of Volume 5C for definition of habitat potential.

3 Project Conditions includes existing activities (with available spatial data + Project.

4 Cumulative Conditions includes existing activities + Project + reasonably foreseeable disturbances (with available spatial data).

5 Incremental and percent change is calculated as the change from existing conditions. ↓ represents a decrease and ↑ represents an increase.

6 Pacific water shrew is modeled using a habitat capability model provided by provincial regulatory agency. Because the model is a capability model (not suitability), only disturbances that were expected to affect habitat capability were included. These disturbances are ones where permanent changes take place, or where normal succession will not be permitted to proceed for an extended period (*e.g.*, pipeline, transmission line, and commercial/industrial footprints). The results indicate the current or future capacity of the habitat to support water shrews. Refer to the Wildlife Modelling and Species Accounts Technical Report of Volume 5C for additional information.

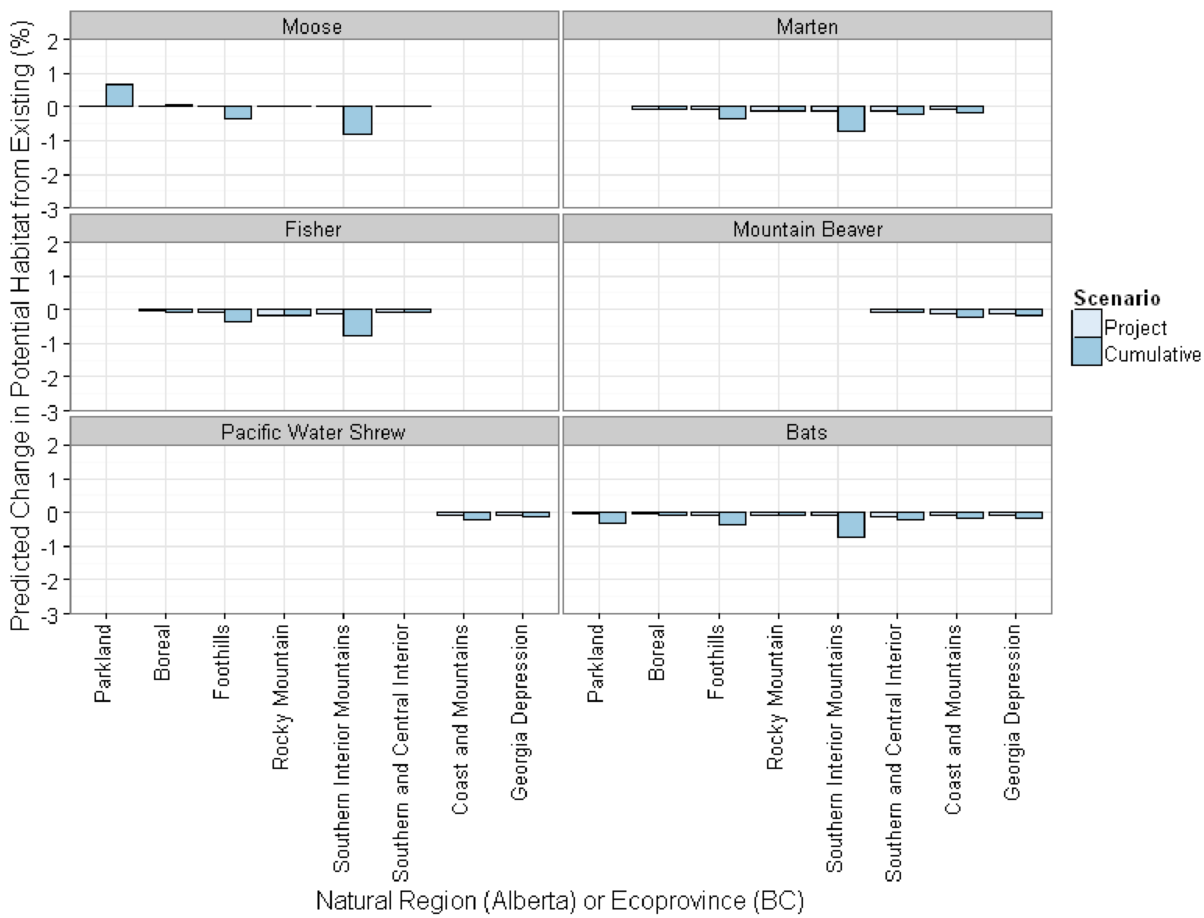

Figure 8.9-3 Predicted Change in Potential Habitat for Mammal Indicators
The predicted change in potential habitat is presented as the percent change from existing conditions to Project conditions and cumulative conditions for each Natural Region (Alberta) and Ecoprovince (BC) within the Wildlife RSA.

Project-specific mitigation measures that will be implemented to reduce regional-scale habitat effects are summarized in Section 7.2.10.6. By implementing the proposed mitigation, the Project's contribution to cumulative effects on mammal habitat will be reduced. It is expected that most other operators in the Grizzly Bear, Caribou and Wildlife RSAs will implement similar best practices and standard mitigation to reduce the contribution of existing and reasonably foreseeable developments to cumulative effects. For the mammal indicators, the predicted change in potential habitat at the regional scale as a result of the Project indicates a very low contribution to cumulative effects. Therefore, mitigation in addition to the measures already proposed in Section 7.0 is not warranted. The commitments outlined in Section 7.2.10.6 to implement additional mitigation beyond the standard measures to address the Project's residual effect on woodland caribou habitat, and to work with regulatory authorities to address potential incremental effects on the proposed/candidate critical habitats for coastal riparian small mammals (*i.e.*, Pacific water shrew, Townsend's mole), are expected to adequately address the Project's contribution to cumulative effects on these sensitive habitats for mammal indicators.

Additional quantitative analyses were completed to inform the assessment of the Project's contribution to cumulative effects on grizzly bear and caribou. These are discussed in the following subsections.

Grizzly Bear

Grizzly bear core (or "core security") habitats are locations with high habitat value and low mortality risk, and are an important component of grizzly bear management (Gibeau *et al.* 2001, Mace and Waller 1998). Core areas can vary in size; 10 km^2 (1,000 ha) is a generally accepted benchmark for defining suitable core roadless areas for grizzly bears (Hamilton pers. comm.). An analysis of grizzly bear core areas was completed using the 'roadless' reciprocal of the moving window motorized access density analysis described below under the mortality risk evaluation for grizzly bear. Grizzly bear core areas were defined as areas ≥ 10 km^2 with a motorized access density of 0 km/km^2, and excluding large lakes, exposed rock and ice (*e.g.*, glaciers).

Results of the grizzly bear core area analysis indicate that the Project will intersect 12 of the core security habitat patches for grizzly bear available under existing conditions in the Grizzly Bear RSA. The Project does not change the number of core patches from existing conditions (Table 8.9-8). The number of core patches is predicted to increase in the North Cascades Grizzly Bear Population Unit (GBPU) (Table 8.9-8) as a result of reasonably foreseeable developments, which is a function of large patches being fragmented into multiple smaller patches that are still of suitable size (*i.e.*, > 10 km/km^2). The number of core security patches in the Robson GBPU decreases from existing conditions as a result of reasonably foreseeable developments (Table 8.9-8), indicating some patches are fragmented into areas too small to be considered core habitat (*i.e.*, < 10 km/km^2). The Project does not have an incremental contribution to cumulative disturbance in grizzly bear core habitat in the Grande Cache, Yellowhead and Columbia-Shuswap GBPUs (*i.e.*, there is no reduction in the total area of core habitat from existing to Project conditions [Figure 8.9-4]). The Project's contribution to cumulative effects on grizzly bear core habitat in the Wells Gray, Robson and North Cascades GBPUs is negligible (Figure 8.9-4).

Management targets for grizzly bear include maintaining a maximum number (*i.e.*, as many as possible) of linked core security habitat patches larger than 10 km^2 within the landscape (Hamilton pers. comm.). The Project is not expected to affect the potential for this target to be achieved. The proposed mitigation in Section 7.0 to reduce the Project's residual effect on grizzly bear habitat is expected to adequately address the Project's contribution to cumulative effects on grizzly bear. No additional mitigation is deemed warranted specifically for cumulative effects on grizzly bear habitat.

TABLE 8.9-8

PREDICTED CHANGE IN GRIZZLY BEAR CORE HABITAT PATCHES

GBPU	Existing Conditions		Project Conditions[2]			Cumulative Conditions[3]		
	Number of Patches	Mean Patch Size (km^2) ± SD	Number of Patches	Number of Patches Intersected[1]	Mean Patch Size (km^2) ± SD	Number of Patches	Number of Patches Intersected[1]	Mean Patch Size (km^2) ± SD
Grande Cache	79	154.618 ± 962.015	79	0	154.618 ± 962.015	79	17	154.573 ± 962.018
Yellowhead	47	167.875 ± 684.172	47	0	167.875 ± 684.172	47	6	167.874 ± 648.172
Columbia-Shuswap	32	184.525 ± 577.870	32	0	184.525 ± 577.870	32	0	184.525 ± 577.870
Wells Gray	27	321.154 ± 1,490.591	27	4	321.1005 ± 1,490.380	27	4	320.910 ± 1,489.392
Robson	33	571.291 ± 1,509.199	33	1	571.257 ± 1,509.033	30	4	570.402 ± 1,507.374
North Cascades	40	112.096 ± 174.287	40	7	112.064 ± 174.298	41	19	108.7136 ± 172.366

Notes: 1 Indicates the number of core patches available under existing conditions that are intersected by the Project and reasonably foreseeable developments. Patches that overlap more than one GBPU are quantified in their entirety for each relevant GBPU.

2 Project conditions include existing activities (with available spatial data + Project).

3 Cumulative conditions include existing activities + Project + reasonably foreseeable developments (with available spatial data).

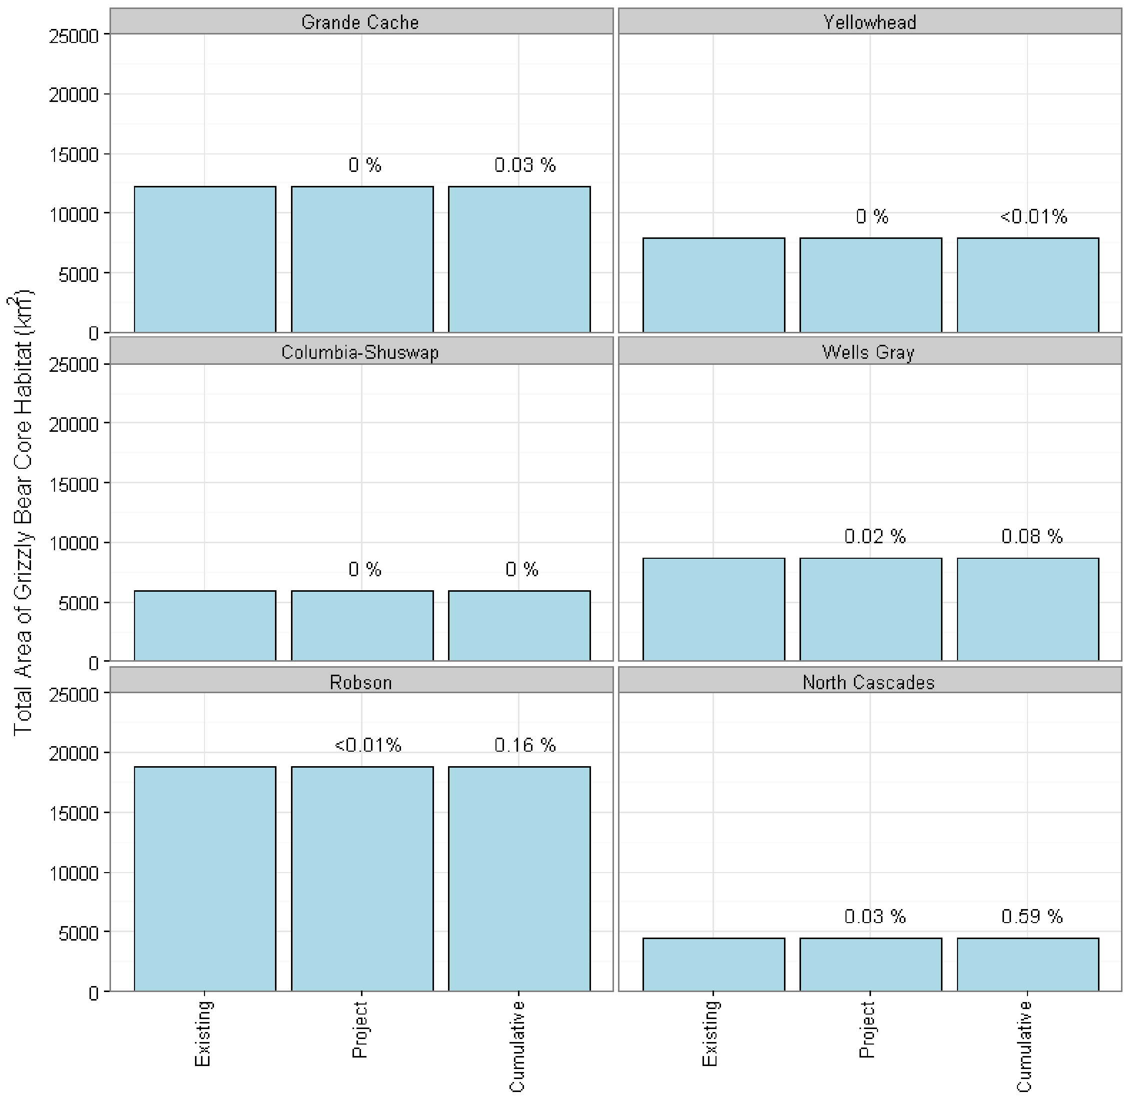

Figure 8.9-4 Predicted Change in Total Area of Grizzly Bear Core Habitat
The total area (km²) of core habitat is the sum of the area of all core habitat patches within each GBPU. The percent change from existing conditions to Project and cumulative conditions is provided numerically above each relevant bar.

Caribou

The Caribou RSA is approximately 1,098,884 ha in size and includes the Wells Gray and Groundhog caribou ranges and associated UWR and WHA (illustrated in the Wildlife Technical Report of Volume 5C). Direct habitat disturbance within the Caribou RSA was quantified based on available existing disturbance data (anthropogenic and fire < 40 years). Functional habitat disturbance incorporates the direct disturbance and the potential zone of influence (reduced habitat effectiveness) within 500 m of anthropogenic disturbance.

Using the method developed for the federal *Recovery Strategy for the Woodland Caribou* (*Rangifer tarandus* caribou)*, Boreal population, in Canada* (Environment Canada 2012), undisturbed caribou habitat is defined as the habitat remaining within the range that has not been burned in the last 40 years and is greater than 500 m from land use features such as clearings and corridors. This method was developed to delineate critical habitat for boreal woodland caribou across Canada (Environment Canada 2008, 2011, 2012). In the absence of current models, measures or thresholds specific to mountain caribou, this approach was adopted for this cumulative effects assessment because it is considered to reflect the widest range of woodland caribou life history conditions. Limitations associated with differences in mountain and boreal caribou life history and spatial segregation of seasonal ranges (especially high value winter ranges) for mountain but not boreal caribou, are acknowledged. The Environment Canada (2012) method for assessing boreal caribou range condition is currently considered the best available quantitative approach for assessing potential cumulative effects on caribou habitat, and allows the expected incremental contribution of existing disturbance, the Project and reasonably foreseeable developments to cumulative effects on caribou habitat to be differentiated.

There is a moderate level (approximately 31.6%) of existing functional habitat disturbance within the Caribou RSA. Cutblocks are the only reasonably foreseeable development identified within the Caribou RSA. Spatial data were not available for future cutblocks at the time of the assessment; therefore, the quantitative assessment of functional disturbance includes only the interaction of the Project with existing activities in the Caribou RSA (Table 8.9-9). Future forest harvest is considered qualitatively in the significance assessment of cumulative effects on caribou habitat. The Project is predicted to contribute to the cumulative functional disturbance in the Caribou RSA by a negligible amount (< 0.01% [Table 8.9-9]).

Environmental Protection and Management Regulation under the BC *Oil and Gas Activities Act* states that operating areas should not be located in a designated UWR unless the operating area will not have a material adverse effect on the ability of the wildlife habitat within the UWR to provide for the survival, within the UWR, of the wildlife species for which the UWR was established. Within the intersected UWR, the proposed pipeline corridor parallels the existing TMPL right-of-way, Highway 5, and an existing railway. Results of the quantitative analysis of caribou habitat change in the Caribou RSA indicate there is no increase in functional habitat disturbance in the caribou UWR as a result of the Project. Despite the relatively low value of the habitat within the proposed pipeline corridor for caribou (due to its low elevation location and existing disturbances), the Project is expected to improve habitat conditions for moose forage and for wolves (prey availability, ease of travel). Wolves have been documented travelling during winter along the existing TMPL in the Caribou RSA (Sturgenor pers. comm.). Wolves are suggested as a primary factor in the decline of mountain caribou in the Caribou RSA. Changes in moose-wolf-caribou interactions are likely the primary mechanism by which the Project will potentially contribute to cumulative effects on caribou. As noted above, mitigation beyond standard measures is warranted to address the Project's residual and incremental contribution to cumulative effects on woodland caribou (*e.g.*, planting conifer seedlings in strategic locations within the Project Footprint, and potentially the existing TMPL). Trans Mountain will work with provincial regulatory authorities, tenure holders and other stakeholders to identify opportunities to address potential residual Project effects on caribou habitat. Implementation of appropriate mitigation is expected to address the Project's residual effect and contribution to cumulative effects (Table 8.9-6 point 2[a]).

TABLE 8.9-9

PREDICTED CHANGE IN HABITAT IN THE CARIBOU REGIONAL STUDY AREA

Caribou Habitat Boundary	Area (ha)	Habitat Disturbance[1]	Existing Conditions (ha)	Project Conditions[2]		
				Project (ha)	Incremental Change (ha)[3]	% Change[3]
Caribou RSA	1,098,884.4	Direct Anthropogenic Disturbance	84,322.1	84,406.8	84.6↑	0.10↑
		Fire < 40 years	15,776.0	15,776.0	0	0
		Functional Disturbance	347,011.8	347,014.2	2.3	< 0.01↑
		Undisturbed	751,872.6	751,870.2	2.3↓	< 0.01↓
UWR	283,467.7	Direct Anthropogenic Disturbance	4,0245.8	40,253.4	7.6↑	0.02↑
		Fire < 40 years	2,769.3	2,769.3	0	0
		Functional Disturbance	147,269.9	147,269.9	0	0
UWR	283,467.7	Undisturbed	136,197.8	136,197.8	0	0

Notes: 1 Direct anthropogenic disturbance: area of anthropogenic disturbance (direct footprint).
Functional disturbance: area of anthropogenic disturbance buffered by 500 m, and fire < 40 years.
Undisturbed: area of caribou range outside of functional disturbance.
2 Cumulative conditions are not presented since there are no reasonably foreseeable developments with available spatial data in the Caribou RSA.
3 Incremental and percent change is calculated as the change from existing conditions. ↓ represents a decrease and ↑ represents an increase.

8.9.6.2 Cumulative Change in Movement of Mammal Indicators

The Project is expected to contribute to cumulative effects on movement of mammal indicators, in combination with existing and reasonably foreseeable future disturbances. Sections 7.2.10.5 and 7.2.10.9 provide discussion of the potential effects mechanisms of the Project on mammal movement. Existing activities and reasonably foreseeable developments and activities are expected to affect mammal movement, in particular high-traffic roads, urban (commercial, residential) and industrial development, and resource extraction (*e.g.*, recent forestry cutblocks, mines). Where the proposed pipeline corridor parallels existing linear features, the incremental increase in the width of the corridor is likely to affect movement of some mammal indicators. Noise and activity during construction and operations will interact with existing activities and reasonably foreseeable developments to affect mammal movement patterns (*e.g.*, barriers, filters, sensory displacement).

To meet management objectives for grizzly bear, one target outcome is to maintain the maximum number of linked core security patches (Hamilton pers. comm.). During the operations phase of the Project, early seral natural vegetation will regenerate over the Project Footprint, access control measures will be implemented to discourage motorized access, and human presence for operational activities (*e.g.*, for monitoring/maintenance activities) is expected to be infrequent. As a result, it is considered unlikely that the proposed pipeline right-of-way will create a barrier to grizzly bear movement that would isolate habitats. Therefore, it is assumed that the grizzly bear habitat fragmented by the Project footprint will remain functionally linked.

Mitigation measures to address the expected Project effects on wildlife movement are provided in Section 7.2.10.6. It is expected that most other operators in the Grizzly Bear, Caribou and Wildlife RSAs will implement similar best practices and standard mitigation. No mitigation measures beyond the Project-specific mitigation are deemed warranted to address the incremental cumulative effect on mammal movement.

8.9.6.3 Cumulative Risk of Mortality for Mammal Indicators

The Project is expected to contribute to incremental mammal mortality risk in combination with existing and reasonably foreseeable disturbances. Improved access for predators and humans, clearing, blasting, traffic and human-wildlife conflicts are likely mechanisms of Project incremental cumulative effects on mammal mortality risk that will interact with existing and reasonably foreseeable disturbances and activities. Application of the proposed mitigation to avoid wildlife mortality associated with traffic, machinery and human-wildlife conflict is expected to reduce the Project's incremental contribution to cumulative mortality risk to negligible levels.

Sections 7.2.10.9 and 8.9.4 discuss the cause-effect relationship between access and wildlife mortality risk from hunting, trapping and predation. Given the linear nature of the primary components of the Project, effects on mammal mortality risk during operations are expected to result largely from access. Linear feature density is a metric that can be used to provide insight into the potential cumulative effects of development on habitat effectiveness and mortality risk (Salmo *et al.* 2003). Linear feature density is a measure of the concentration of linear features (*e.g.*, roads, transmission lines, railways and pipelines) on the landscape. Since road density thresholds are available for grizzly bear, a quantitative analysis was completed to inform the assessment of cumulative effects on grizzly bear mortality risk.

The BC Identified Wildlife Species Account for grizzly bear recommends an open road density of less than 0.6 km/km² to meet access management objectives in grizzly bear areas (BC MWLAP 2004). The Alberta Grizzly Bear Recovery Plan identifies objectives that would limit the rate of human-caused mortality per Bear Management Area (or GBPU) by maintaining open road densities at or below 0.6 km/km² in Grizzly Bear Priority Areas, and at or below 1.2 km/km² in all remaining grizzly bear range (ASRD 2008).

Open road density thresholds are inconsistently applied to various combinations of linear feature data sets in different management regions. For example, some jurisdictions use open road density to mean only primary and secondary roads, while other jurisdictions include all anthropogenic linear features for which spatial data are available. The validity of including seismic lines as access is uncertain, since there is a large amount of variation in the ability of these features to facilitate motorized access during the growing season, and the available spatial data does not differentiate between seismic lines of varying width, continuity and vegetation regeneration. For the purposes of this assessment, the analysis of access density used a combination of linear feature data to represent motorized access, as identified in Table 8.9-10.

TABLE 8.9-10

ACCESS DENSITY PARAMETERS

Parameter	Details
Performance Measure	Motorized Access Density (km/km²)
Definition	Access routes (without closures/restrictions) that receive conventional and/or off-road vehicle (*e.g.*, ATV) use
Threshold	0.6 km/km²
Spatial Data Features	• Primary Roads • Secondary Roads • Tertiary Roads • Transmission Lines • Power Lines • Pipelines

A moving window (sometimes called ‘roving window’) approach is often used in grizzly bear studies for calculating access density (Allen *et al.* 2011). The moving window approach calculates the density of linear features in the neighbourhood (‘window’) of each output raster cell (‘pixel’) in the middle of the window (ESRI 2012). Access density was computed using a moving window analysis in ArcGIS with a 500 m circular window radius (*i.e.*, a 1 km window) and 30 m^2 pixels. Results were provided by GBPU, and categorized into strata based on known access density thresholds for grizzly bear (Hamilton pers. comm.):

- 0 km/km²;
- > 0 to 0.6 km/km²;
- > 0.6 to 1.2 km/km²;
- > 1.2 to 2.4 km/km²; and
- > 2.4 km/km².

The proposed pipeline and power lines were included in the analysis of the Project’s contribution to motorized access density. The locations of access roads needed to construct and operate the Project are unknown at the time of assessment. It is understood that the majority of access will utilize existing access roads. Access is considered qualitatively in addition to the quantitative analysis in the characterization of effects and determination of significance.

Results of the moving window analysis (Table 8.9-11) indicate that the existing average motorized access density in the Columbia-Shuswap, Wells Gray, Robson and North Cascades GBPUs currently exceeds the threshold of 0.6 km/km², suggesting a high risk of grizzly bear mortality and displacement under current conditions in these GBPUs. The predicted cumulative contribution of the Project and reasonably foreseeable developments to motorized access density will not cause the average density to exceed 0.6 km/km² at the regional (*i.e.*, GBPU) scale for those GBPUs currently below this threshold under existing conditions (*i.e.*, Grande Cache and Yellowhead GBPUs). Figure 8.9-5 shows the predicted change in motorized access density, as a proportion of each GBPU, from existing to Project and cumulative conditions. The combined change in the proportion of each GBPU in each access density category as a result of the Project and reasonably foreseeable developments is minimal for all GPBUs (*i.e.*, < 0.4% change from existing conditions). In some instances, the Project has the apparent effect of reducing the access density (*e.g.*, Wells Gray and Robson GBPUs [Table 8.9-11]), since the proposed pipeline corridor is located between existing linear features and will effectively join currently separated corridors into a single wide corridor, thereby reducing the corridor density.

The results indicate that the average motorized access density at the GBPU scale does not change substantially as a result of the Project (Table 8.9-11). However, the proposed route and foreseeable future disturbances are predicted to have a localized effect on the motorized access density within each GBPU intersected by the Project, which will cause localized increases from baseline conditions below 0.6 km/km² to levels that exceed the threshold. Figures 8.9-6 to 8.9-11 illustrate the minor extent of the localized contribution to combined disturbance from the Project and reasonably foreseeable developments to the motorized access density in each GBPU intersected by the Project, whereby the density is predicted to exceed the 0.6 km/km² threshold for grizzly bear.

TABLE 8.9-11

PREDICTED CHANGE IN MOTORIZED ACCESS DENSITY FROM EXISTING CONDITIONS IN THE GRIZZLY BEAR REGIONAL STUDY AREA

	Existing Conditions	Project Conditions[1]		Cumulative Conditions[2]	
GBPU	Average Density ± Standard Deviation (km/km²)	Average Density ± Standard Deviation (km/km²)[3]	% Change in Average Density from Existing Conditions[3]	Average Density ± Standard Deviation (km/km²)	% Change in Average Density from Existing Conditions[3]
Grande Cache	0.34 ± 0.76	0.34 ± 0.76	< 0.01 ↑	0.34 ± 0.76	< 0.01 ↑
Yellowhead	0.27 ± 0.70	0.27 ± 0.70	< 0.01 ↑	0.27 ± 0.70	< 0.01 ↑
Columbia-Shuswap	1.07 ± 1.30	1.07 ± 1.30	< 0.01 ↑	1.07 ± 1.30	< 0.01 ↑
Wells Gray	0.66 ± 1.15	0.66 ± 1.15	< 0.01 ↓	0.66 ± 1.15	< 0.01 ↓
Robson	0.75 ±1.28	0.75 ± 1.28	< 0.01 ↓	0.75 ± 1.29	< 0.01 ↑
North Cascades	1.05 ± 1.38	1.05 ± 1.38	< 0.01 ↑	1.06 ± 1.40	0.01↑

Notes: 1 Project Conditions includes existing activities (with available spatial data) + Project disturbances.

2 Cumulative Conditions includes existing activities + Project + reasonably foreseeable developments (with available spatial data).

3 ↓ represents a decrease and ↑ represents an increase.

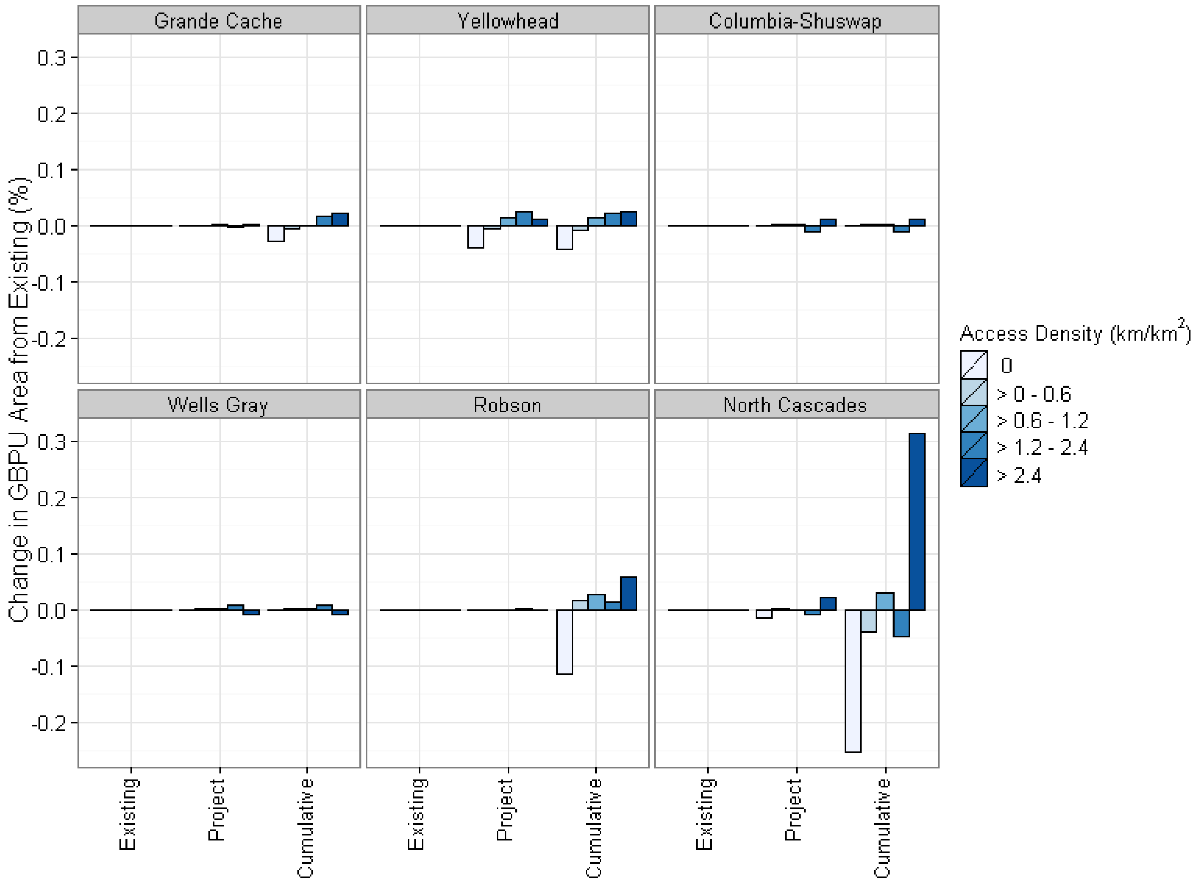

Figure 8.9-5 Predicted Change in Motorized Access Density by GBPU
Changes in motorized access density are presented as the percent change from existing conditions with respect to the proportion of the GBPU represented by each access density strata.

201311_MAP_TERA_WL_00484_Rev0_06.mxd

The mitigation proposed in Section 7.2.10.6 to address the Project's residual effects on mammal indicators is expected to adequately address the Project's contribution to cumulative effects on mammal mortality risk with one exception. The Project will contribute to grizzly bear mortality risk in the North Cascades GBPU, causing an incremental effect on mortality risk for a threatened population. To address the Project's contribution to this cumulative effect, additional mitigation beyond that identified in Section 7.2.10.6 is warranted. This mitigation may include additional access control and habitat restoration both on the Project Footprint and the existing TMPL within the North Cascades GBPU (*e.g.*, barriers to block access, signs, planting woody vegetation) and allowing select segments of the Footprint to regenerate to natural vegetation across the width of the right-of-way. Trans Mountain will work with the appropriate regulatory authorities to develop a mitigation strategy to address the Project's incremental cumulative effect on grizzly bear in the North Cascades GBPU.

8.9.6.4 Summary of Significance Rationale for Incremental Cumulative Effects on Mammal Indicators

A summary of the significance criteria ratings for the mammal indicators is provided in Table 8.9-6. The criteria ratings and rationale for spatial boundary, duration, frequency, reversibility and probability are similar for all of the mammal indicators.

- Spatial boundary: RSA – cumulative effects on wildlife are best evaluated at the regional (landscape) scale. The Project's contribution to combined habitat loss and alteration, movement effects, and mortality risk may interact with existing and reasonably foreseeable development within the RSA relevant to the indicator (*i.e.*, Wildlife, Caribou or Grizzly Bear RSA) to cause cumulative effects on mammal indicators.
- Duration: short-term – Project construction (*e.g.*, clearing, creation of new access) and operational activities (*e.g.*, monitoring, vegetation management and site-specific maintenance) are short-term events that will interact with existing activities and reasonably foreseeable developments to have an incremental contribution to cumulative effects.
- Frequency: periodic – Project construction (*e.g.*, clearing, creation of new access) and operational activities (*e.g.*, monitoring, vegetation management and site-specific maintenance) will occur intermittently over the assessment period to interact with existing activities and reasonably foreseeable developments, causing an incremental contribution to cumulative effects.
- Reversibility: long-term – incremental cumulative effects of the Project will extend over the long-term, until the Project is decommissioned and abandoned, and habitat is restored within the Footprint.
- Probability: high – the Project will interact with existing activities and reasonably foreseeable developments to affect the indicator.

The criteria ratings and rationale for magnitude and confidence vary, and are provided below for each mammal indicator.

Grizzly Bear

- Magnitude: medium – grizzly bear is a species of conservation concern provincially and federally, largely due to extensive range and population reductions influenced by habitat development and fragmentation, and human-related conflicts and mortality. The Project will have a negligible contribution to cumulative effects on grizzly bear core habitat and mortality risk at the regional scale. Nonetheless, the Project and reasonably foreseeable disturbances will contribute to local increases in motorized access density in each GBPU crossed by the proposed pipeline corridor, causing a change in motorized access density from existing conditions below 0.6 km/km² to levels that exceed the threshold. The Project will contribute to grizzly bear mortality risk in the North Cascades GBPU, causing an incremental effect on mortality risk for a threatened population. To address this incremental cumulative effect, additional mitigation beyond that identified in Section 7.2.10 is warranted, which may include the measures noted above. Trans Mountain will work with the appropriate regulatory authorities to develop a mitigation strategy to address the Project's contribution to cumulative effects on grizzly bear in the North Cascades GBPU. With implementation of appropriate mitigation, the magnitude of the Project's contribution to cumulative effects on grizzly bear is concluded to be medium.

- Confidence: moderate – the assessment is based on a good understanding of cause-effect relationships and relevant data. Limitations and uncertainty associated with available data pertinent to the Project area reduce the confidence level to moderate.

Woodland Caribou

- Magnitude: medium – the Wells Gray and Groundhog caribou herds are Threatened under Schedule 1 of *SARA*. The Project is predicted to contribute to the cumulative disturbance of functional habitat in the Caribou RSA by a negligible amount (< 0.01%) and will not change the existing area of functional habitat disturbance in the UWR (Table 8.9-9). Although the Project is expected to have a negligible effect on caribou habitat value, caribou are sensitive to human disturbance, and research has demonstrated adverse interactions between linear disturbance, primary prey and predator response, and caribou mortality. Given the sensitivity of woodland caribou, regulatory guidelines and management objectives, mitigation beyond standard measures is warranted to address the Project's residual and incremental contribution to cumulative effects on woodland caribou. Measures may include additional access control and habitat restoration both on the Project Footprint and the existing TMPL right-of-way. Trans Mountain will develop an appropriate mitigation plan in consultation with regulatory authorities to address the Project's residual and cumulative effects on caribou. Implementation of the measures in the plan, in addition to the proposed mitigation provided in Section 7.2.10, is expected to reduce the magnitude of the Project's contribution to cumulative effects on caribou to medium.

- Confidence: moderate – the assessment is based on a reasonable understanding of cause-effect relationship; limitations are associated with the absence of models, measures or thresholds specific to mountain ecotype woodland caribou.

Moose

- Magnitude: low – moose are highly valued as a game species and for traditional and cultural purposes, but do not have conservation status designations of concern, either provincially or federally. Moose populations are considered more sensitive to overharvest and other sources of mortality than to habitat loss and fragmentation. Hunting is often the primary limiting factor of moose populations in areas accessible to humans. Predation by wolves is an important factor for moose mortality, and may be associated with declines in moose populations recently observed in the North Thompson region. BC MFLNRO actively monitors and manages moose populations. The Project's contribution to cumulative effects on moose is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

- Confidence: moderate – the assessment is based on a good understanding of cause-effect relationships and relevant data. Limitations and uncertainty associated with available data pertinent to the Project area reduce the confidence level to moderate.

Forest Furbearers

- Magnitude: low – the forest furbearer indicator group includes species of conservation concern (*e.g.*, fisher, wolverine). These species are managed as furbearers (*i.e.*, for harvest) in BC and Alberta. Habitat loss (forest clearing from human development) and trapping are primary threats to furbearer populations. The Project's contribution to cumulative effects on forest furbearers is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

- Confidence: moderate – the assessment is based on a good understanding of cause-effect relationships and relevant data. Limitations and uncertainty associated with available data pertinent to the Project area reduce the confidence level to moderate.

Coastal Riparian Small Mammals

- Magnitude: medium – the Project crosses proposed critical habitat for Pacific water shrew and early candidate critical habitat for Townsend's mole (Environment Canada 2013). The sensitive status of various coastal riparian small mammal species is attributable largely to the existing high level of cumulative habitat disturbance in the LMDA. The Project is predicted to have a small contribution to cumulative effects on coastal riparian small mammals at the regional scale. In addition to the Project-specific mitigation, Trans Mountain will work with regulatory authorities to address potential incremental effects on the proposed/candidate critical habitats for coastal riparian small mammals (*i.e.*, Pacific water shrew, Townsend's mole). Additional mitigation may include habitat restoration measures within disturbed riparian areas. With implementation of appropriate mitigation, the magnitude of the Project's contribution to cumulative effects on coastal riparian small mammals is concluded to be medium.

- Confidence: low – the assessment is based on an incomplete understanding of cause-effect relationships (*i.e.,* limited research and literature is available for these species), and limitations and uncertainty associated with the available data used to assess the Project's incremental cumulative effect.

Bats

- Magnitude: low - Several bat species with conservation status of concern occur in the LSA. Known threats to bat populations are limited (*e.g.*, wind energy development, white-nose syndrome). The potential effects of the Project (*e.g.*, change in habitat and mortality risk) may contribute to other existing and potential future threats to have a cumulative effect on bats. The Project's contribution to cumulative effects on bats is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

- Confidence: low - The assessment is based on an incomplete understanding of cause-effect relationships (*i.e.*, limited research and literature is available for these species), and limitations and uncertainty associated with the available data used to assess the Project's incremental cumulative effect.

8.9.7 Significance Evaluation of Potential Cumulative Effects on Birds

The Project is likely to interact with existing and reasonably foreseeable disturbances to contribute to cumulative effects on habitat, movement and mortality risk of birds within the Wildlife RSA (Table 8.9-5). Table 8.9-12 provides a summary of the significance evaluation of the Project's contribution to cumulative effects on bird indicators. The assessment rationale is provided below.

TABLE 8.9-12

SUMMARY OF SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON BIRD INDICATORS

	Cumulative Effect	Impact Balance	Spatial Boundary[1]	Temporal Context			Magnitude	Probability	Confidence	Significance[2]
				Duration	Frequency	Reversibility				
1.	Wildlife Indicator – Grassland/Shrub-steppe Birds

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.9.7.1 Cumulative Change in Habitat for Bird Indicators

The Project will contribute to loss or alteration of habitat for the bird indicators in combination with natural disturbance, existing activities and reasonably foreseeable developments. Table 8.9-13 and Figures 8.9-12 and 8.9-13 summarize the predicted changes in potential and effective habitat for bird indicators as a result of cumulative disturbance within the Wildlife RSA.

TABLE 8.9-13

PREDICTED CHANGE IN POTENTIAL AND EFFECTIVE HABITAT FOR BIRD INDICATORS IN THE WILDLIFE REGIONAL STUDY AREA

Wildlife Indicator[1]	Potential/Effective Habitat[2]	Area (ha) of Potential Habitat in the Wildlife RSA						
			Project Conditions[3]			Cumulative Conditions[4]		
		Existing Conditions	Project Conditions	Incremental Change[5]	% Change[5]	Cumulative Conditions	Incremental Change[5]	% Change[5]
Grassland/Shrub-Steppe Birds	Potential	276,320.4	276,901.4	580.9 ↑	0.21 ↑	276,053.7	266.7 ↓	0.10 ↓

Notes:
1. Potential contribution of the Project to cumulative effects on great blue heron and bald eagle is expected to be site-specific and mitigable with the proposed mitigation measures in Section 7.2.10. These indicators were not suited to quantification of potential habitat using available data.
2. Refer to the Wildlife Modeling and Species Accounts Technical Report of Volume 5C for definition of habitat potential. Where suitability models were applied for RSA-scale analysis, the change in effective habitat is indicated rather than potential habitat.
3. Project Condition includes existing activities (with available spatial data) + Project.
4. Cumulative Condition includes existing activities + Project + reasonably foreseeable developments (with available spatial data).
5. Percent change is calculated as the change from existing conditions. ↓ represents a decrease and ↑ represents an increase.

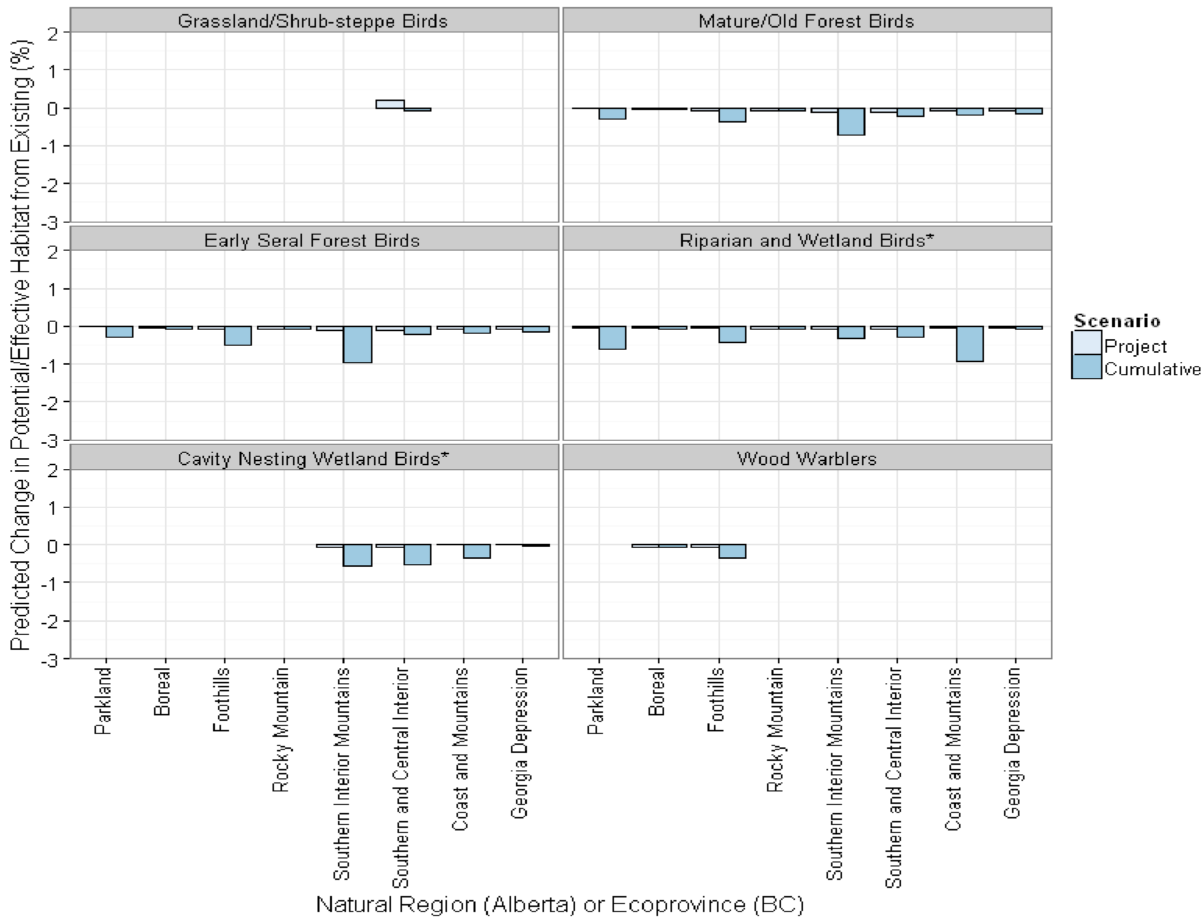

Figure 8.9-12 Predicted Change in Potential/Effective Habitat for Bird Community Indicators

The predicted change in habitat is presented as the percent change from existing conditions to Project conditions and cumulative conditions for each Natural Region (Alberta) and Ecoprovince (BC) within the Wildlife RSA. Change in effective habitat is indicated by an asterisk (*); change in potential habitat is presented for the other community indicators. Cavity nesting wetland birds were modeled separately as part of the riparian and wetland birds community indicator.

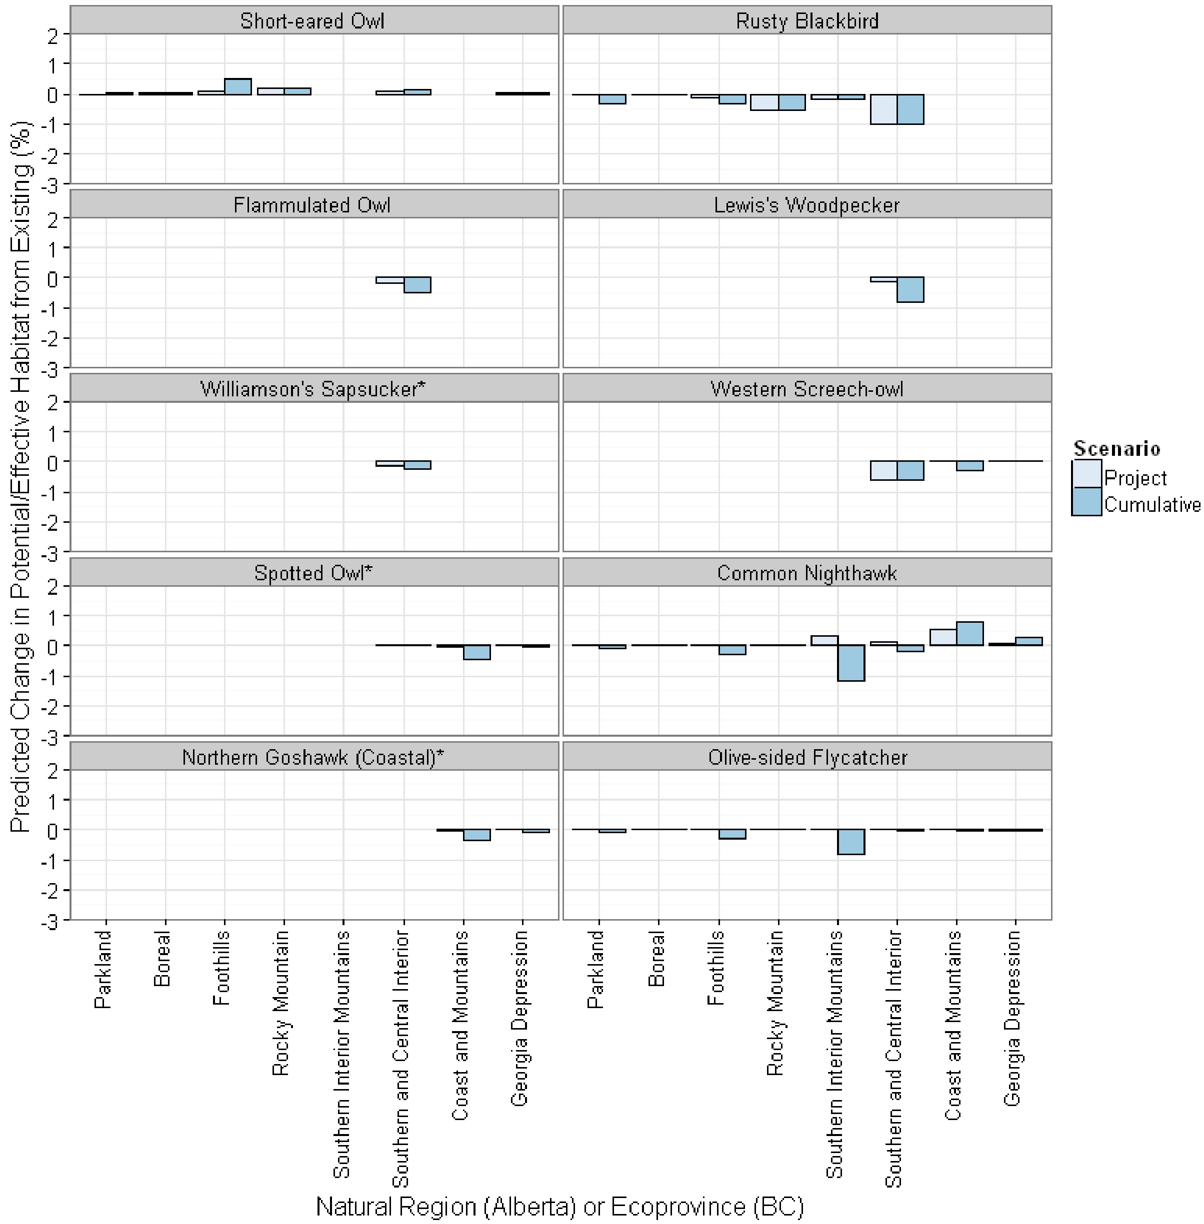

Figure 8.9-13 Predicted Change in Potential/Effective Habitat for Bird Indicators

The predicted change in habitat is presented as the percent change from existing conditions to Project conditions and cumulative conditions for each Natural Region (Alberta) and Ecoprovince (BC) within the Wildlife RSA. Change in effective habitat is indicated by an asterisk (*); change in potential habitat is presented for the other bird indicators. Both the interior and coastal western screech-owl are provided in the results at the species level, but can be distinguished by the Ecoprovince (*i.e.*, interior subspecies occurs within the Southern and Central Interior Ecoprovince; coastal subspecies occurs within the Coast and Mountains, and Georgia Depression Ecoprovince).

Project-specific mitigation measures that will be implemented to reduce regional-scale habitat effects are summarized in Section 7.2.10. By implementing the proposed mitigation, including working with regulatory authorities to address potential incremental effects on the proposed/candidate critical habitats for Lewis's woodpecker and Williamson's sapsucker, the Project's contribution to cumulative effects on bird habitat will be reduced. It is expected that many other operators in the Wildlife RSA will implement similar best practices and standard mitigation to reduce the contribution of existing and reasonably foreseeable developments to cumulative effects.

Given the species' sensitivity, regulatory guidelines (*e.g.*, no-net-loss policy for spotted owl habitat in the Sowaqua Spotted Owl Wildlife Habitat Area 2-498), management objectives, and existing levels of cumulative effects on spotted owl, additional mitigation beyond the standard measures is warranted to address the Project's residual and incremental cumulative effect within the WHA for spotted owl traversed by the proposed pipeline corridor. This additional mitigation commitment is included in the residual Project effects assessment (Section 7.2.10). A mitigation plan will be developed for the Project, which is anticipated to include measures to avoid, mitigate, restore and offset adverse effects on spotted owl habitat. Mitigation measures are anticipated to include efforts to minimize clearing, restore areas within the WHA that are not needed for long-term operations, and offsets. Consultation with BC MFLNRO regarding the Project's interaction with the WHA and an appropriate approach for mitigating effects has been initiated and is ongoing.

8.9.7.2 Cumulative Change in Movement and Mortality Risk for Bird Indicators

Construction and operations of the Project has potential to contribute to cumulative effects on bird movement and mortality risk. The Project's incremental effects are likely to interact with the identified existing activities and reasonably foreseeable developments in the Wildlife RSA (Table 8.9-5) to cause cumulative changes to bird movement, in particular where the proposed pipeline corridor parallels existing linear disturbance and will increase the corridor width. As discussed in Section 7.2.10.10, parallel forest openings can cause a cumulative barrier effect at the landscape scale for some bird species (Bélisle and St. Clair 2001).

Vegetation clearing for the Project will create new access and edges, which may combine with existing disturbance to have cumulative effects on bird mortality risk. Cumulative changes in access at the regional scale can affect hunting pressure for game birds such as grouse. Although numerous studies in forested landscapes have found no evidence of increased nest predation due to either forestry (Bayne and Hobson 1997, Cotterill and Hannon 1999, Ibarzabal and Desrochers 2001, Schmiegelow and Mönkkönen 2002) or roads (Ortega and Capen 1999), some species (*e.g.*, marbled murrelet) have substantially higher probability of nest disturbance in proximity to edges compared to forest interior (Section 7.2.10.10). Regional differences in predator communities can also influence the potential effects of fragmentation on nest predation (Chalfoun *et al.* 2002).

With implementation of the mitigation proposed in Section 7.2.10, the Project's contribution to cumulative effects on movement and mortality risk for the bird indicators is expected to be small at the regional scale. It is expected that many other operators in the Wildlife RSA will implement similar best practices and standard mitigation to reduce the contribution of existing activities and reasonably foreseeable developments to cumulative effects on bird mortality risk. No mitigation measures beyond the Project-specific mitigation proposed in Section 7.2.10 are deemed warranted.

8.9.7.3 Summary of Significance Rationale for Incremental Cumulative Effects on Bird Indicators

A summary of the significance criteria ratings for the Project's contribution to cumulative effects on bird indicators is provided in Table 8.9-12. The criteria ratings and rationale for spatial boundary, duration, frequency, reversibility and probability are similar for all of the bird indicators.

- Spatial boundary: Wildlife RSA – cumulative effects on birds are best evaluated at the regional (landscape) scale.
- Duration: short-term – Project construction and operational activities are short-term events that will interact with existing activities and reasonably foreseeable developments to contribute to cumulative effects.
- Frequency: periodic – Project construction and operational activities that could interact with existing activities and reasonably foreseeable developments will occur intermittently over the assessment period.
- Reversibility: long-term – the Project's contribution to cumulative effects will extend over the long-term until the Project is decommissioned and abandoned, and habitat is restored within the Footprint.

- Probability: high – the Project will interact with existing activities and reasonably foreseeable developments to affect bird indicators.
- Confidence: moderate – the assessment is based on a good understanding of cause-effect relationships and relevant data. Limitations and uncertainty associated with available data pertinent to the Wildlife RSA reduce the confidence level to moderate.

The criteria ratings and rationale for magnitude vary, and are provided below for each bird indicator.

Grassland/Shrub-Steppe Birds

- Magnitude: medium – the Project is likely to interact with existing and reasonably foreseeable developments in the grasslands region of interior BC. In particular, the Project will interact with the proposed Ajax open pit mine project and other existing (*e.g.*, City of Kamloops, agriculture) and reasonably foreseeable developments and activities in the grassland and shrub-steppe habitats within the Wildlife RSA traversing the interior of BC. Locally within this area, the overall cumulative effects from past and foreseeable future disturbance on the grassland/shrub-steppe bird community and other grassland dependent wildlife species is potentially high. However, the Project's contribution to cumulative effects on grassland/shrub-steppe birds is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of medium magnitude.

Mature/Old Seral Forest Birds

- Magnitude: low – the Project's contribution to cumulative effects on mature/old seral forest birds is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

Early Seral Forest Birds

- Magnitude: low - the Project's contribution to cumulative effects on early seral forest birds is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

Riparian and Wetland Birds

- Magnitude: low – the Project's contribution to cumulative effects on riparian and wetland birds is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

Wood Warblers

- Magnitude: low – the Project's contribution to cumulative effects on wood warblers is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

Short-eared Owl

- Magnitude: negligible – the primary threat to the short-eared owl is loss of nesting habitat due to rapid urbanization, industrialization, intensive agriculture and human disturbance. Fragmentation of habitats may cause fluctuations in the population of their rodent prey base (COSEWIC 2008, Demarchi and Bently 2005). Short-eared owl may use disturbed sites, although anthropogenic habitats may have lower value than natural openings. Sensory disturbance and mortality risk during construction will potentially interact with other existing activities and reasonably foreseeable developments to cumulatively affect short-eared owl. The magnitude of the Project's contribution to cumulative effects on short-eared owl is concluded to be negligible at the regional scale.

Rusty Blackbird

- Magnitude: low – the Project's contribution to cumulative effects on rusty blackbird is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

Flammulated Owl

- Magnitude: low – the Project's contribution to cumulative effects on flammulated owl is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

Lewis's Woodpecker

- Magnitude: medium – Lewis's woodpecker is a species of conservation concern at both the provincial (BC) and federal levels. Small population size and low density makes the species vulnerable to disturbance and habitat loss, particularly the loss of nesting trees and snags. The Project crosses candidate critical habitat for Lewis's woodpecker. The Project's contribution to cumulative effects on Lewis's woodpecker is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk (including working with regulatory authorities to address potential incremental effects on the candidate critical habitat), is concluded to be of medium magnitude.

Williamson's Sapsucker

- Magnitude: medium – Williamson's sapsucker is a species of conservation concern at both the provincial (BC) and federal levels. Small population size and low density makes the species vulnerable to disturbance and habitat loss, particularly the loss of nesting trees and snags. The Project crosses proposed critical habitat for Williamson's sapsucker. The Project's contribution to cumulative effects on Williamson's sapsucker is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk (including working with regulatory authorities to address potential incremental effects on the proposed critical habitat), is concluded to be of medium magnitude.

Western Screech-Owl

- Magnitude: low – the Project's contribution to cumulative effects on western screech-owl is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk is concluded to be of low magnitude.

Great Blue Heron

- Magnitude: negligible – with application of the proposed mitigation to address residual effects on great blue heron habitat, movement and mortality risk, the Project's contribution to cumulative effects on great blue heron is concluded to be negligible at the regional scale.

Spotted Owl

- Magnitude: medium – the Project is likely to interact with existing activities and reasonably foreseeable developments in the Wildlife RSA to affect spotted owl. In particular, the proposed Hope to Burnaby Segment of the Project is likely to interact with the high levels of existing urban and agricultural development, as well as the proposed Interior–Lower Mainland Transmission Project between Merritt and Coquitlam, which intersects identified spotted owl habitats (BC Hydro 2013c). Consultation with BC MFLNRO regarding the Project's interaction with the WHA and an appropriate approach for mitigating effects has been initiated and is ongoing. A mitigation plan will be developed in consultation with BC MFLNRO, which is anticipated to include measures to avoid, mitigate, restore and offset adverse effects on spotted owl habitat, as noted above. With application of appropriate mitigation, the Project's contribution to cumulative effects on spotted owl is concluded to be of medium magnitude.

Bald Eagle

- Magnitude: negligible – with application of the proposed mitigation to address residual effects on bald eagle habitat, movement and mortality risk, the Project's contribution to cumulative effects on bald eagle is concluded to be negligible at the regional scale.

Common Nighthawk

- Magnitude: low – declines in common nighthawk populations are attributed to various anthropogenic and natural causes, in particular changes in insect abundance, fire control and reductions in availability of suitable anthropogenic nesting habitat (*e.g.*, gravel rooftops). Construction and operations of the Project is unlikely to interact with these threats to have a detectable contribution to cumulative effects on common nighthawk. Common nighthawks are generally tolerant of habitat change and may use disturbed sites, although anthropogenic habitats may have lower value for nighthawk than natural openings. Sensory disturbance and mortality risk during construction will potentially interact with other existing activities and reasonably foreseeable developments to cumulatively affect common nighthawk. The magnitude of the Project's contribution to cumulative effects on common nighthawk is concluded to be low at the regional scale.

Northern Goshawk

- Magnitude: low – loss of mature forest (nesting and foraging habitat) may be the most important factor threatening goshawks in BC. Construction and operations of the Project will interact with existing and reasonably foreseeable disturbances to have cumulative effects on northern goshawk. The Project's contribution to cumulative effects on northern goshawk is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

Olive-Sided Flycatcher

- Magnitude: low – the Project's contribution to cumulative effects on olive-sided flycatcher is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

8.9.8 Significance Evaluation of Potential Cumulative Effects on Amphibian and Reptile Indicators

The Project is likely to interact with existing and reasonably foreseeable disturbances to contribute to cumulative effects on habitat, movement and mortality risk of amphibians and reptiles within the Wildlife RSA. Table 8.9-14 provides a summary of the significance evaluation of the Project's incremental cumulative effects on amphibian and reptile indicators. The assessment rationale is provided below.

TABLE 8.9-14

SUMMARY OF SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON AMPHIBIAN AND REPTILE INDICATORS

	Cumulative Effect	Impact Balance	Spatial Boundary[1]	Temporal Context			Magnitude	Probability	Confidence	Significance[2]
				Duration	Frequency	Reversibility				
1.	Wildlife Indicator – Pond-dwelling Amphibians									
1(a)	Project contribution to cumulative effects on pond-dwelling amphibians.	Negative	RSA	Short-term	Periodic	Long-term	Low	High	Moderate	Not significant
2.	Wildlife Indicator – Stream-dwelling Amphibians									
2(a)	Project contribution to cumulative effects on stream-dwelling amphibians.	Negative	RSA	Short-term	Periodic	Long-term	Medium	High	Moderate	Not significant
3.	Wildlife Indicator – Arid Habitat Snakes									
3(a)	Project contribution to cumulative effects on arid habitat snakes.	Negative	RSA	Short-term	Periodic	Long-term	Low	High	Moderate	Not significant

Notes: 1 RSA = Wildlife RSA.

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.9.8.1 Cumulative Change in Habitat for Amphibian and Reptile Indicators

The Project will contribute to combined loss or alteration of amphibian and reptile habitat resulting from natural disturbance, existing activities and reasonably foreseeable developments. Table 8.9-15 and Figure 8.9-14 summarize the predicted combined changes in effective and potential habitat for amphibian and reptile indicators as a result of the Project and reasonably foreseeable developments to cumulative disturbance within the Wildlife RSA.

TABLE 8.9-15

PREDICTED CHANGE IN POTENTIAL HABITAT FOR AMPHIBIAN AND REPTILE INDICATORS IN THE WILDLIFE REGIONAL STUDY AREA

Wildlife Indicator	Potential/ Effective Habitat[1]	Area (ha) of Potential Habitat in the Wildlife RSA						
			Project Condition[2]			Cumulative Conditions[3]		
		Existing Conditions	Project Conditions	Incremental Change[4]	% Change[4]	Cumulative Conditions	Incremental Change[4]	% Change[4]
Pond-Dwelling Amphibians	Effective	269,976.0	269,855.1	121.0 ↓	0.04 ↓	269,485.4	490.6 ↓	0.18 ↓
Coastal Tailed Frog (Stream-Dwelling Amphibians Indicator)	Effective	145,828.6	145,707.4	121.2 ↓	0.08 ↓	145,598.8	229.9 ↓	0.16 ↓
Western Rattlesnake (Arid Habitat Snakes Indicator)	Potential	80,709.7	80,741.9	32.1 ↑	0.04 ↑	79,510.2	1,199.5 ↓	1.49 ↓

Notes: 1 Refer to the Wildlife Modeling and Species Accounts Technical Report of Volume 5C for definition of habitat potential. Where suitability models were applied for RSA-scale analysis, the change in effective habitat is indicated rather than potential habitat.

2 Project Condition includes existing activities (with available spatial data) + Project.

3 Cumulative Condition includes existing activities + Project + reasonably foreseeable developments (with available spatial data).

4 ↓ represents a decrease and ↑ represents an increase.

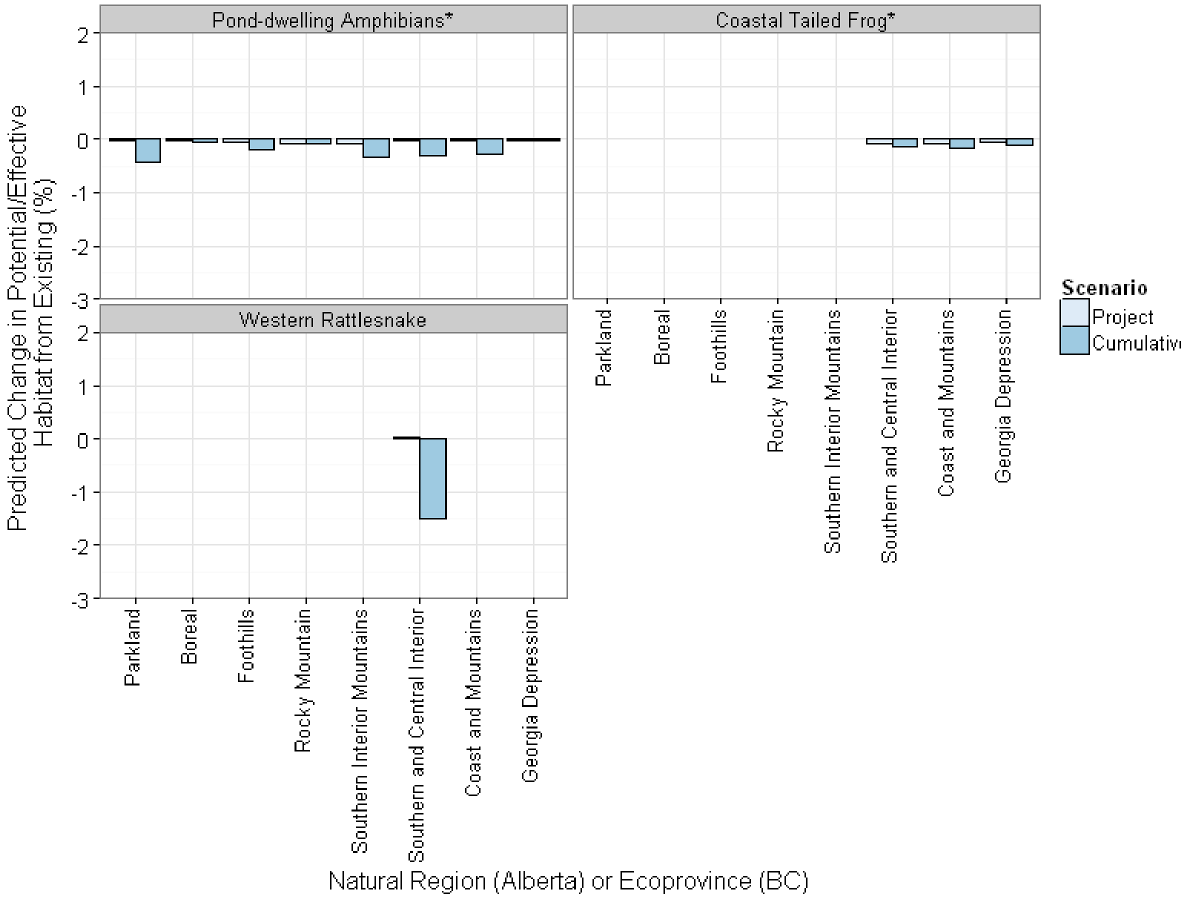

Figure 8.9-14 Predicted Change in Potential/Effective Habitat for Amphibian and Reptile Indicators
The predicted change in habitat is presented as the percent change from existing conditions to Project conditions and cumulative conditions for each Natural Region (Alberta) and Ecoprovince (BC) within the Wildlife RSA. Change in effective habitat is indicated by an asterisk (*) for pond-dwelling amphibians and coastal frog; change in potential habitat is presented for western rattlesnake living habitat.

Project-specific mitigation measures that will be implemented to reduce regional-scale habitat effects are summarized in Section 7.2.10.6. By implementing the proposed mitigation, including working with regulatory authorities to address potential incremental effects on the early candidate critical habitat for Pacific giant salamander, the Project's contribution to cumulative effects on amphibian and reptile habitat will be reduced. It is expected that many other operators in the Wildlife RSA will implement similar best practices and standard mitigation to reduce the contribution of existing activities and reasonably foreseeable developments to cumulative effects. No mitigation measures beyond the Project-specific mitigation proposed in Section 7.2.10 are deemed warranted.

8.9.8.2 Cumulative Change in Movement and Mortality Risk for Amphibian and Reptile Indicators

Construction and operations of the Project has potential to contribute to cumulative effects on amphibian and reptile movement and mortality risk. The Project's incremental effects are likely to interact with the identified existing activities and reasonably foreseeable developments in the Wildlife RSA (Table 8.9-5) to cause cumulative changes to movement and mortality risk for the amphibian and reptile indicators. With implementation of the mitigation proposed in Section 7.2.10, the Project's contribution to cumulative effects on amphibian and reptile movement and mortality risk is expected to be small at the regional scale. It is expected that many other operators in the Wildlife RSA will implement similar best practices and standard mitigation to reduce the contribution of existing activities and reasonably foreseeable developments to cumulative effects. No mitigation measures beyond the Project-specific mitigation proposed in Section 7.2.10 are deemed warranted.

8.9.8.3 Summary of Significance Rationale for Incremental Cumulative Effects on Amphibian and Reptile Indicators

A summary of the significance criteria ratings for the amphibian and reptile indicators is provided in Table 8.9-14. The criteria ratings and rationale for spatial boundary, duration, frequency, reversibility, probability and confidence are similar for all of the amphibian and reptile indicators.

- Spatial boundary: Wildlife RSA – cumulative effects on amphibians and reptiles are best evaluated at the regional (landscape) scale.
- Duration: short-term – Project construction and operational activities (*e.g.*, monitoring, vegetation management and site-specific maintenance) are short-term events that will interact with existing activities and reasonably foreseeable developments to contribute to cumulative effects.
- Frequency: periodic – Project construction and operational activities (*e.g.*, monitoring, vegetation management and site-specific maintenance) that could interact with existing activities and reasonably foreseeable developments will occur intermittently but repeatedly over the assessment period.
- Reversibility: long-term – some habitats suitable for amphibians and reptiles may be restored following reclamation of the Project Footprint in the medium-term. However, the reversibility is constrained by the time necessary to restore habitats that will take longer to regenerate to suitable conditions (*e.g.*, forested areas, sagebrush shrub-steppe), and Project components that will not be restored until decommissioning (*e.g.*, facilities). The Project's contribution to cumulative effects will extend over the long-term, until the Project is decommissioned and abandoned, and habitat is restored within the Footprint.
- Probability: high – the Project will interact with existing activities and reasonably foreseeable developments to affect amphibian and reptile indicators.
- Confidence: moderate – the assessment is based on a good understanding of cause-effect relationships and relevant data. Limitations and uncertainty associated with available data pertinent to the Wildlife RSA reduce the confidence level to moderate.

The criteria ratings and rationale for reversibility and magnitude vary, and are provided below for each amphibian and reptile indicator.

Pond-Dwelling Amphibians

- Magnitude: low – the pond-dwelling amphibians indicator includes several species with conservation status of concern. Pond-dwelling amphibians require wetland and upland habitats, and movement corridors between these areas. Amphibian populations are declining over much of North America, and primary threats include habitat loss and degradation, barriers to movement, and mortality risk (*e.g.*, from predation). Cumulative habitat loss, fragmentation by road networks and developments, and risks associated with roads during annual migrations are attributed to putting western toad at risk. The Project's contribution to cumulative effects on pond-dwelling amphibians is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

Stream-Dwelling Amphibians

- Magnitude: medium – siltation of streams and alteration of hydrological regime can adversely affect stream-dwelling amphibians. The Project has potential to interact with existing and future activities, in particular forest harvest and associated roads, to have cumulative effects on stream-dwelling amphibians. Clear-cuts can cause siltation of streams and alter the hydrological regime, both of which may negatively affect breeding success of tailed frogs (Dupuis and Steventon 1999, Wahbe *et al.* 2004). There is some evidence that the density of tailed frog tadpoles is greater in streams running through clear-cuts relative to those that do not, and that this may be linked to increased primary productivity in clear-cuts (Wahbe *et al.* 2004). The cumulative interaction of the Project on coastal tailed frog with future disturbance is considered qualitatively in the effects characterization and determination of significance. A series of run-of-river hydro developments are underway or proposed on streams in the Wildlife RSA. These developments divert water from the stream to produce hydro-electric power; however, run-of-the-river projects rely on stable, substantial stream flow (BC Ministry of Energy, Mines and Petroleum Resources 2011). For this reason, it is unlikely that these developments would interact with the Project to cumulatively affect quality habitat for stream-dwelling amphibians, which require step-pool stream morphology and lower, albeit year-round, water flow. The Project's contribution to cumulative effects on stream-dwelling amphibians is expected to be small at the regional scale, but will contribute to cumulative effects on sensitive species and habitats (*e.g.*, early candidate critical habitat for Pacific giant salamander). With application of the proposed mitigation to address residual effects on habitat, movement and mortality risk (including working with regulatory authorities to address potential effects on candidate critical habitat), the Project's contribution to cumulative effects on stream-dwelling amphibians is concluded to be of medium magnitude.

<u>Arid Habitat Snakes</u>

- Magnitude: low – arid snake species are particularly vulnerable to disturbance and local extirpation. Habitat loss and direct mortality due to road construction, utility development, agricultural expansion and urban expansion are the main threats to these species (Southern Interior Reptile and Amphibian Recovery Team 2008a,b). The Project's contribution to cumulative effects on arid habitat snakes is expected to be small at the regional scale, and with application of the proposed mitigation to address residual effects on habitat, movement and mortality risk, is concluded to be of low magnitude.

8.9.9 Summary

As identified in Tables 8.9-6, 8.9-12 and 8.9-14, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on wildlife and wildlife habitat are concluded to be not significant.

8.10 Species at Risk

As discussed in Section 7.2.11, potential effects of the Project on species at risk are assessed through the use of indicators in Section 7.2.7 Fish and Fish Habitat, Section 7.2.9 Vegetation and Section 7.2.10 Wildlife and Wildlife Habitat. Consequently, the cumulative effects assessment on combined effects of the Project on indicator species at risk is conducted in Section 8.6 Fish and Fish Habitat, Section 8.8 Vegetation and Section 8.9 Wildlife and Wildlife Habitat.

Similar to Section 7.0, although not all species at risk are discussed explicitly under each indicator, potential cumulative effects were assessed in consideration of all species at risk. The indicators used to represent fish and fish habitat, vegetation and wildlife and wildlife habitat were carefully selected to ensure that the full range of potential Project effects and Project contribution to cumulative effects on species at risk was addressed and mitigations to reduce these effects will apply to all species at risk, not just the indicators. Sections 8.6 Fish and Fish Habitat, Section 8.8 Vegetation and Section 8.9 Wildlife and Wildlife Habitat provide the significance rationale for applicable indicator species. No significant adverse cumulative effects on species at risk have been identified as a result of the pipeline and facilities component of the Project.

8.11 Marine Sediment and Water Quality

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to cumulatively affect marine sediment and water quality indicators that were anticipated to have an adverse combined Project-specific residual effect (*i.e.*, marine sediment quality and marine water quality).

8.11.1 Reasonably Foreseeable Developments

Three certain and reasonably foreseeable developments are identified within the Marine RSA (Table 8A.1-1 of Appendix 8.1) that are considered in the evaluation of cumulative effects on marine sediment and water quality indicators. All three developments (Neptune Bulk Terminal Ltd., Richardson International Ltd. and Seaspan ULC expansion projects) are located in the Inner Harbour, west of the

Second Narrows, and distant from the Marine Sediment and Water Quality LSA. These developments are also summarized in Table 8.11-1.

TABLE 8.11-1

ANTICIPATED REASONABLY FORESEEABLE DEVELOPMENTS IN THE MARINE RSA

Project	Proponent	Description	Status
Coal Handling Infrastructure Upgrade and Expansion Project	Neptune Bulk Terminals Ltd.	Upgrade and expansion of metallurgical coal handling systems - increased vessel traffic expected to be approximately one vessel per week.	Under construction – in-service by late 2014.
Grain Storage Capacity Project	Richardson International Ltd.	Installation of approximately 494 open-ended steel wall piles and 315 timber piles, and construction of two 40,000 metric tonne concrete storage annexes.	Under construction – in-service by early 2015.
Shipyard Modernization Project	Seaspan ULC	Construction of a 53.56 m long x 31.8 m wide concrete load-out pier and installation of approximately 102 steel piles.	Under construction – in-service by early 2015..

The potential effects of increased vessel traffic, both Project and non-Project related, on marine water quality would be relevant to the marine transportation assessment (Section 4.3.2 of Volume 8A), however, the types of interactions expected would be limited to increases in potential for accidental release of bilge water from vessels, which is addressed in terms of accidents and malfunctions (Section 4.3.13 of Volume 8A).

Existing diffuse sources of contaminants in the Marine RSA, such as vessel traffic, marinas, port facilities, and stormwater discharges from urban areas and the effects of the 2007 accidental oil release from a ruptured Trans Mountain pipeline into Burrard Inlet have been accounted for in the baseline conditions described in the Marine Sediment and Water Quality – Westridge Marine Terminal Technical Report of Volume 5C.

8.11.2 Potential Cumulative Effects

The potential and likely environmental residual effects associated with construction and operation of the Westridge Marine Terminal on marine sediment and water quality indicators were identified in Section 7.11.1.10 and are listed in Table 8.11-2 along with existing activities and reasonably foreseeable developments that could act in combination with the Project.

TABLE 8.11-2

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON MARINE SEDIMENT AND WATER QUALITY CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Combined Project effects on marine sediment quality.	RSA	Westridge Marine Terminal	Construction to Operation	Project contribution to cumulative change in marine sediment quality.	• Vessel loading at Westridge Marine Terminal. • Existing activities: stormwater runoff into the Marine RSA and vessel traffic in the Marine RSA. • Reasonably foreseeable developments within the Marine RSA listed in Table 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including dredging for construction of the Westridge Marine Terminal.

TABLE 8.11-2 Cont'd

2. Combined Project effects on marine water quality.	RSA	Westridge Marine Terminal	Construction to Operation	Project contribution to cumulative change in marine water quality.	• Existing activities: discharge of treated stormwater from the existing Westridge Marine Terminal, vessel traffic in the Marine RSA, stormwater runoff in the Marine RSA. • Reasonably foreseeable developments within the Marine RSA listed in Table 8A.1-6 of Appendix 8.1 and discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including discharges of treated stormwater from the expanded Westridge Marine Terminal.

Note: 1 RSA = Marine RSA.

8.11.3 Significance Evaluation of Potential Cumulative Effects

Table 8.11-3 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on marine sediment and water quality indicators. The rationale used to evaluate the significance of each cumulative effect is provided below. Characterization of the Project's contribution to cumulative effects relied on available research literature and the professional judgment of the assessment team.

TABLE 8.11-3

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON MARINE SEDIMENT AND WATER QUALITY

Potential Cumulative Effects	Impact Balance	Spatial Boundary[1]	Temporal Context: Duration	Temporal Context: Frequency	Temporal Context: Reversibility	Magnitude	Probability	Confidence	Significance[2]
1. Marine Sediment and Water Quality Indicator – Marine Sediment Quality									
1(a) Project contribution to cumulative change in marine sediment quality.	Negative	LSA	Short-term	Isolated	Short-term	Low	Low	High	Not significant
2. Marine Sediment and Water Quality Indicator – Marine Water Quality									
2(a) Project contribution to cumulative change in marine water quality.	Negative	LSA	Long-term	Periodic	Short-term	Low	Low	High	Not significant
3. Combined Effects on Marine Sediment and Water Quality									
3(a) Project contribution to cumulative increase in effects on marine sediment and water quality indicators (1[a] and 2[a]).	Negative	LSA	Long-term	Periodic	Short-term	Low	Low	High	Not significant

Notes: 1 LSA = Marine Sediment and Water Quality LSA.
2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.11.3.1 Marine Sediment and Water Quality Indicator – Marine Sediment Quality

Dredging of a limited area for the Westridge Marine Terminal may be required, and would occur within the Project Footprint. Dredging has the potential to disturb existing contaminants in sediment (*e.g.*, polycyclic aromatic hydrocarbons [PAHs], polychlorinated biphenyls [PCBs], metals), resulting in their suspension and resettling. Residual effects of dredging are considered to be low in magnitude and short-term in duration. The use of a clamshell dredge and, if practical, turbidity curtains around the dredge location will restrict sediment disturbance and resettling to the Marine Sediment and Water Quality LSA.

Construction and operation activities associated with the three reasonably foreseeable developments listed above and described in Table 8A.1-6 of Appendix 8.1 will not overlap in time or space with Project activities. Construction methods for these developments are not provided, and they may or may not involve sediment disturbance from dredging or other activities. However, these developments are scheduled for completion in 2014 or 2015, prior to the Project construction schedule, and are located well away (in the Inner Harbour, within the Marine RSA) from the Westridge Marine Terminal, such that any spatial or temporal overlap with Project construction activities is not anticipated. As a result, the probability of the Project contributing to cumulative effects on marine sediment quality is considered low and any cumulative effects that do arise are predicted to be low in magnitude (Table 8.11-3, point 1[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on marine sediment quality is provided below.

- Spatial Boundary: Marine Sediment and Water Quality LSA – no spatial or temporal overlap between Project activities within the LSA and other reasonably foreseeable developments in the RSA is anticipated.
- Duration: short-term – Project activities at the Westridge Marine Terminal that have the potential to contribute to cumulative effects on marine sediment quality are limited to the construction phase.
- Frequency: isolated – Project activities at the Westridge Marine Terminal that have the potential to contribute to cumulative effects on marine sediment quality are limited to the construction phase.
- Reversibility: short-term – sediment disturbed by in-water construction activities will resettle within hours to days following cessation of construction activities at the Westridge Marine Terminal.
- Magnitude: low – mitigation measures will be implemented to restrict dispersion of sediment during dredging; no change in sediment quality is predicted; existing sediment meets disposal at sea screening criteria for PAH and PCBs but not for metals (small exceedance of Environment Canada disposal at sea criteria for copper, lead, and cadmium, consistent with other parts of the Marine RSA).
- Probability: low – timing of reasonably foreseeable developments in the Marine RSA will not overlap with the construction schedule for the Westridge Marine Terminal.
- Confidence: high – there is a good understanding of the cause-effect relationships between in-water construction activities and the re-suspension of contaminants, the effectiveness of proposed mitigation measures, and the spatial extent of changes in marine sediment quality resulting from Project activities at the Westridge Marine Terminal.

8.11.3.2 Marine Sediment and Water Quality Indicator – Marine Water Quality

Construction of the expanded Westridge Marine Terminal has the potential to affect marine water quality through release of total suspended solids (TSS) during dredging. The use of a clamshell dredge and, if practical, turbidity curtains around the dredge location will restrict sediment disturbance and elevated TSS levels to the Marine Sediment and Water Quality LSA.

Operation of the expanded Westridge Marine Terminal has the potential to affect marine water and, indirectly, sediment, through release of surface water (stormwater) runoff from the site. Runoff may contain hydrocarbons, metals and suspended sediment. Of these, hydrocarbons are of particular concern at an oil shipping terminal. Increased concentrations of contaminants can lead to toxicity in marine biota. Given the many existing sources of stormwater contaminants in Burrard Inlet (Balanced Environmental Services Inc. 2010), it can be difficult to identify specific contaminant sources.

The reasonably foreseeable developments listed above and described in Table 8A.1-6 of Appendix 8.1 may release TSS during their construction phases; however, Project effects will be localized and there will be no temporal or spatial overlap of Project and non-Project related construction activities and effects. These projects may also release stormwater during their operation phases. However, discharges at industrial sites require permits and monitoring programs similar in extent to that required of the Westridge Marine Terminal and may require treatment (*e.g.*, settling of sediment, removal of oil). As a result, any effects on water quality from industrial stormwater discharges are expected to be localized and low in magnitude. Given that the reasonably foreseeable developments are located away from the Marine Sediment and Water Quality LSA, there is unlikely to be any spatial overlap with Project effects. As a result, the probability of the Project contributing to cumulative effects on marine water quality is considered low and any cumulative effects that do arise are predicted to be low in magnitude (Table 8.11-3, point 2[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on marine water quality is provided below.

- Spatial Boundary: Marine Sediment and Water Quality LSA – no spatial or temporal overlap between Project activities within the LSA and other reasonably foreseeable developments in the RSA is anticipated.
- Duration: long-term – stormwater discharges from the reasonably foreseeable developments may begin during the construction phase of the Westridge Marine Terminal and extend into the operations phase.
- Frequency: periodic – stormwater discharges will occur intermittently but repeatedly over the assessment period (during rainfall events).
- Reversibility: short-term – each event is reversible immediately after dredging ceases or stormwater is released; however, the overall effect of stormwater discharge will not cease until the end of operations at the Westridge Marine Terminal.
- Magnitude: low – site runoff from the Westridge Marine Terminal, existing industrial sites and reasonably foreseeable developments will be within permit requirements, which are set to protect marine aquatic biota.
- Probability: low – based on the lack of spatial overlap between the Project and reasonably foreseeable developments in the Marine RSA.
- Confidence: high – there is a good understanding of the cause-effect relationships between industrial operations and stormwater, effectiveness of stormwater treatment, and the spatial extent of changes in marine water quality resulting from Project activities at the Westridge Marine Terminal.

8.11.3.3 Combined Cumulative Effects on Marine Sediment and Water Quality

The potential cumulative effects (*i.e.*, change in marine sediment quality and change in marine water quality) may act in combination to affect marine sediment and water quality in the Marine RSA. However, given that there will be little if any spatial or temporal overlap between Project-specific effects on marine sediment and water quality and reasonably foreseeable developments in the Marine RSA, the probability of combined cumulative effects is considered low. Implementing mitigation measures described in Section 7.0 will reduce the spatial extent of Project-related changes in marine sediment and water quality, making combined cumulative effects even more unlikely. As a result, combined cumulative effects of the Project on marine sediment and water quality are predicted to be low in magnitude (Table 8.11-3, point 3[a]). A summary of the rationale for all of the significance criteria of combined cumulative effects on marine sediment and water quality indicators is provided below.

- Spatial Boundary: Marine Sediment and Water Quality LSA – no spatial or temporal overlap between Project activities within the LSA and other reasonably foreseeable developments in the RSA is anticipated.
- Duration: long-term – the events causing combined cumulative effects on marine sediment and water quality will extend through the construction and operations phases of the Project.
- Frequency: periodic – the events causing combined cumulative effects on marine sediment and water quality will occur intermittently but repeatedly over the assessment period.
- Reversibility: short-term – Project contribution to combined cumulative effects on marine sediment and water quality will reverse after each stormwater event soon after the discharge stops and will cease when the facility is decommissioned.

- Magnitude: low – the Project's contribution to combined cumulative effects on marine sediment and water quality is considered to be within environmental standards given the implementation of industry standard guidelines and recommended mitigations.
- Probability: low – based on the lack of spatial and temporal overlap between the Project and reasonably foreseeable developments.
- Confidence: high – there is a good understanding of the cause-effect relationships between Project activities and marine sediment and water quality, and effectiveness of proposed mitigation measures, and the spatial extent of changes in marine sediment and water quality resulting from Project activities.

8.11.4 Summary

As identified in Table 8.11-3, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on marine sediment and water quality within the Marine RSA will be not significant.

8.12 Marine Fish and Fish Habitat

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to cumulatively affect marine fish and fish habitat indicators that were anticipated to have an adverse combined Project-specific residual effect (*i.e.*, intertidal habitat, subtidal habitat, Dungeness crab, inshore rockfish and Pacific salmon).

8.12.1 Reasonably Foreseeable Developments

Three certain and reasonably foreseeable developments were identified within the Marine RSA: the Neptune Terminals Coal Handling Expansion Project; the Richardson International Grain Storage Capacity Expansion Project; and the Seaspan Modernization Project. These developments are listed in Table 8A.1-6 of Appendix 8.1 and are described in Section 8.1.4. Only the Seaspan Modernization Project will involve in-water works; therefore, it is the only reasonably foreseeable development that has the potential to contribute to cumulative effects on marine fish and fish habitat.

8.12.2 Potential Cumulative Effects

The potential and likely combined environmental residual effects associated with construction and operation of the Westridge Marine Terminal on marine fish and fish habitat were identified in Section 7.11.1.11 and are listed in Table 8.12-1 along with existing activities and reasonably foreseeable developments that could act in combination with the Project.

Construction of the Westridge Marine Terminal will result in the loss of a small area of marine riparian habitat; however, this residual effect is not considered in the context of cumulative effects because none of the three reasonably foreseeable developments in the Marine RSA will affect marine riparian habitat. While construction of the Seaspan load-out pier will affect intertidal and subtidal habitats, the site is heavily industrialized and there is no marine riparian habitat present.

The assessment of potential Project effects on inshore rockfish and Pacific salmon resulting from construction of the Westridge Marine Terminal concluded that injury or mortality are unlikely (see Section 7.6.9.6). As a result, these effects are not considered in the context of cumulative effects. Operational activities at the Westridge Marine Terminal are not expected to affect marine fish and fish habitat; therefore, there is no potential for cumulative effects during the operations phase of the Project.

TABLE 8.12-1

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON MARINE FISH AND FISH HABITAT CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Loss of intertidal habitat due to construction activities.	RSA	Westridge Marine Terminal	Construction	Project contribution to cumulative loss of intertidal habitat.	• Historical changes to intertidal habitat in the Marine RSA due to past industrial and urban developments. • Seaspan Modernization Project described in Section 8.1.4 and listed in Table 8A.1-6 of Appendix 8.1.
2. Loss of subtidal habitat due to construction activities.	RSA	Westridge Marine Terminal	Construction	Project contribution to cumulative loss of subtidal habitat.	• Historical changes to subtidal habitat in the Marine RSA due to past industrial and urban developments. • Seaspan Modernization Project described in Section 8.1.4 and listed in Table 8A.1-6 of Appendix 8.1.
3. Combined Project effects on Dungeness crab.	RSA	Westridge Marine Terminal	Construction	Project contribution to cumulative increase in injury or mortality and cumulative decrease in productive capacity of suitable habitat.	• Historical changes to intertidal and subtidal habitat in the Marine RSA due to past industrial and urban developments. • Seaspan Modernization Project described in Section 8.1.4 and listed in Table 8A.1-6 of Appendix 8.1.
4. Decrease in productive capacity of suitable habitat for Pacific salmon.	RSA	Westridge Marine Terminal	Construction	Project contribution to cumulative decrease in productive capacity of suitable habitat.	• Historical changes to intertidal and subtidal habitat in the Marine RSA due to past industrial and urban developments. • Seaspan Modernization Project described in Section 8.1.4 and listed in Table 8A.1-6 of Appendix 8.1.
5. Decrease in productive capacity of suitable habitat for Pacific salmon.	RSA	Westridge Marine Terminal	Construction	Project contribution to cumulative decrease in productive capacity of suitable habitat.	• Historical changes to intertidal and subtidal habitat in the Marine RSA due to past industrial and urban developments. • Seaspan Modernization Project described in Section 8.1.4 and listed in Table 8A.1-6 of Appendix 8.1.

Note: 1 RSA = Marine RSA.

8.12.3 Significance Evaluation of Potential Cumulative Effects

Table 8.12-2 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on marine fish and fish habitat indicators. The rationale used to evaluate the significance of each of the cumulative effects is provided below. Characterization of the Project's contribution to cumulative effects relied on studies of the historical changes to marine habitats in the Marine RSA, a qualitative assessment of the potential residual effects of the Seaspan Modernization Project on marine fish and fish habitat, and professional judgment of the assessment team.

TABLE 8.12-2

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON MARINE FISH AND FISH HABITAT

Notes: 1 RSA = Marine RSA.

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.12.3.1 Marine Fish and Fish Habitat Indicator – Intertidal Habitat

Intertidal habitats in Burrard Inlet have been extensively modified as a result of historical development. A study by Stantec Consulting Ltd. (Stantec) (2009) estimated that 69% of intertidal habitats in Burrard Inlet have been converted to riprap (52%) or retaining walls (17%). Natural rocky intertidal habitat, tidal flats/estuaries, and beaches comprise 13%, 11% and 7% of the shoreline, respectively.

Shoreline infilling for construction of the Westridge Marine Terminal will result in the loss of approximately 5,470 m^2 of intertidal habitat, most of which is riprap. This loss will be partially offset by the creation of an estimated 3,770 m^2 of new intertidal riprap habitat along the outer face of the fill area. All intertidal habitat affected by construction of the Westridge Marine Terminal has been classified as ‘man-made’ (BC Ministry of Forests 2005).

Of the three reasonably foreseeable developments that overlap with the Marine RSA, the Seaspan Modernization Project is the only one that will affect marine fish habitats. Construction of the load-out pier is expected to result in the loss of several hundred square metres of intertidal habitat. Shoreline at the development site has been classified as ‘man-made’ (BC Ministry of Forests 2005) and aerial imagery suggests that the intertidal habitat is composed entirely of riprap (PMV 2013i).

The cumulative effect of intertidal habitat loss in the Marine RSA resulting from historical development, Project construction and reasonably foreseeable developments is considered to have a negative impact balance and is predicted to be of medium magnitude. The major contributor to this effect is the legacy of industrial and urban development that has linearized much of the natural shoreline and replaced structurally complex habitats with riprap and retaining walls. The Project’s contribution to the cumulative loss of intertidal habitat is predicted to be of low magnitude (Table 8.12-2, point 1[a]) because only a small area of previously-modified intertidal habitat will be lost. Although this cumulative effect is permanent, the implementation of a marine fish habitat compensation/offset program will ensure that there is no net loss of the productive capacity of fish habitat. The intertidal riprap habitat created as a product of infilling will also function as marine fish habitat, and is expected to be colonized by a suite of marine organisms similar to what is currently found at the site. A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on intertidal habitat is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to intertidal habitat loss may interact with historical and reasonably foreseeable developments within the Marine RSA to cause a cumulative loss of intertidal habitat in the Marine RSA.
- Duration: short-term – the Project's contribution to a cumulative loss of intertidal habitat will result from shoreline infilling at the Westridge Marine Terminal, which is expected to take 1 to 2 months during the construction phase.
- Frequency: isolated – the Project's contribution to a cumulative loss of intertidal habitat will result from shoreline infilling at the Westridge Marine Terminal, which is confined to the construction phase.
- Reversibility: permanent – the Project's contribution to a cumulative loss of intertidal habitat is permanent.
- Magnitude: low – construction of the Westridge Marine Terminal will result in the loss of a relatively small amount of previously-modified intertidal habitat, which represents a small contribution to the overall cumulative effect.
- Probability: high – construction of the Westridge Marine Terminal will result in the loss of intertidal habitat and this will act cumulatively with historical and reasonably foreseeable in-water developments in the Marine RSA.
- Confidence: high – based on a good understanding of the historical changes to intertidal habitats within the Marine RSA, a good understanding of the residual Project effects on intertidal habitat and a good understanding of the reasonably foreseeable developments that have the potential to impact intertidal habitat in the Marine RSA.

8.12.3.2 Marine Fish and Fish Habitat Indictor – Subtidal Habitat

Historical development in Burrard Inlet has led to the loss of subtidal habitat, primarily through infilling of nearshore areas to increase useable land for industrial developments. Since the 1930s, approximately 363 ha of inlet area have been lost due to infilling (Stantec 2009). It is likely that earlier development in the late 1800s and early 1900s also contributed to the loss of natural subtidal habitats, although this has not been quantified.

Construction of the Westridge Marine Terminal will result in the loss of approximately 17,100 m^2 of subtidal habitat, primarily soft-sediment (sand and mud) with a small area of riprap. This loss will be partially offset by the creation of an estimated 5,550 m^2 of new subtidal riprap habitat along the outer face of the fill area. Rocky habitat is limited in Burrard Inlet, so although the subtidal riprap is anthropogenic, it will provide high value habitat for a variety of marine fish species, including rockfish, which associate with complex rocky habitats. Nevertheless, the Project's contribution to the cumulative loss of subtidal habitat is considered to have a negative impact balance.

A small amount of subtidal habitat will be lost due to construction of the Seaspan load-out pier. The proposed footprint of this in-water development is 1,720 m^2, most of which will be subtidal. Habitats in this area appear to be primarily soft-sediment, although aerial imagery suggests that subtidal riprap may also be present (PMV 2013i)

The cumulative effect of subtidal habitat loss in the Marine RSA resulting from historical development, Project construction and reasonably foreseeable developments is predicted to be of medium magnitude. While construction of the Westridge Marine Terminal and the Seaspan load-out pier will result in relatively small losses of subtidal habitat, historical developments in Burrard Inlet have reduced the inlet area by at least 363 ha (Stantec 2009). Although subtidal habitat loss is permanent, both Trans Mountain and Seaspan will implement fish habitat compensation/offset programs to ensure that their respective developments do not result in the loss of the productive capacity of fish habitats. Under the *Fisheries Act*, all unavoidable losses of fish habitat must be compensated/offset through the creation of new habitats or the restoration or enhancement of existing habitats.

The Project's contribution to the cumulative loss of subtidal habitat, therefore, is predicted to be of low magnitude (Table 8.12-2, point 2[a]). A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on subtidal habitat is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to subtidal habitat loss may interact with historical and reasonably foreseeable developments within the Marine RSA to cause a cumulative loss of subtidal habitat in the Marine RSA.
- Duration: short-term – the Project's contribution to a cumulative loss of subtidal habitat is limited to the construction phase, resulting from shoreline infilling at the Westridge Marine Terminal, which is expected to take 1 to 2 months, and pile installation, which will occur intermittently over a 2 year period.
- Frequency: isolated – the Project's contribution to a cumulative loss of subtidal habitat will result from shoreline infilling and pile installation at the Westridge Marine Terminal, which is confined to the construction phase.
- Reversibility: permanent – the Project's contribution to the cumulative loss of subtidal habitat is permanent.
- Magnitude: low – construction of the Westridge Marine Terminal will result in the loss of a relatively small amount of soft-sediment subtidal habitat, which will be offset by the creation of subtidal riprap habitat and the implementation of a marine fish habitat compensation/offset program.
- Probability: high – construction of the Westridge Marine Terminal will result in the loss of subtidal habitat and this will act cumulatively with historical and reasonably foreseeable in-water developments in the Marine RSA.
- Confidence: high – based on a good understanding of the historical changes to subtidal habitats within the Marine RSA, a good understanding of the residual Project effects on subtidal habitat and a good understanding of the reasonably foreseeable developments that have the potential to impact subtidal habitat in the Marine RSA.

8.12.3.3 Marine Fish and Fish Habitat Indictor – Dungeness Crab

<u>Cumulative Decrease in Productive Capacity of Suitable Habitat for Dungeness Crab</u>

Historical infilling and shoreline modification in Burrard Inlet has likely reduced the productive capacity of Dungeness crab habitat within the Marine RSA; however, the Inlet remains a productive area for Dungeness crab, supporting commercial, recreational and Aboriginal fisheries (DFO 2012). Marine habitat losses associated with construction of the Westridge Marine Terminal and the Seaspan load-out pier will act cumulatively with historical developments to reduce the overall availability of Dungeness crab habitat in the Marine RSA, and this is considered to have a negative impact balance. The associated loss of productive capacity will be temporary, as both Trans Mountain and Seaspan will implement fish habitat compensation/offset programs to ensure there is no net loss of productive capacity. Although specific compensation/offset measures have not yet been determined for the Project, the preferred option involves the construction of a series of subtidal rock reefs near the Westridge Marine Terminal. These reefs would provide rearing habitat for recently-settled Dungeness crab larvae and foraging habitat for sub-adult and adult crabs. A diverse community of algae and invertebrates would colonize the reefs within a period of two to three years after their construction, increasing productivity and prey availability in the local area.

With the implementation of a marine fish habitat compensation/offset program, the Project's contribution to the cumulative decrease in productive capacity of Dungeness crab habitat is predicted to be of low magnitude and reversible in the medium-term (Table 8.12-2, point 3[a]). A summary of the rationale for all of the significance criteria for the Project's contribution to cumulative effects on the productive capacity of Dungeness crab is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to marine habitat loss may interact with historical and reasonably foreseeable developments within the Marine RSA to cause a cumulative decrease in the productive capacity of suitable habitat for Dungeness crab in the Marine RSA.
- Duration: short-term – Project activities at the Westridge Marine Terminal that have the potential to contribute to a cumulative decrease in the productive capacity of suitable habitat for Dungeness crab are limited to the construction phase.
- Frequency: isolated – Project activities at the Westridge Marine Terminal that have the potential to contribute to a cumulative decrease in the productive capacity of suitable habitat for Dungeness crab are confined to the construction phase.
- Reversibility: medium-term – implementation of a marine fish habitat compensation/offset program will ensure there is no net loss of the productive capacity of Dungeness crab habitat; full recovery of productive capacity may take 2 to 3 years following the installation of compensation/offset features.
- Magnitude: low – construction of the Westridge Marine Terminal will decrease the productive capacity of Dungeness crab habitat in only a small portion of the Marine RSA and this effect will be offset through the implementation of a marine fish habitat compensation/offset program.
- Probability: high – construction of the Westridge Marine Terminal will affect Dungeness crab habitat resulting in a temporary decrease in productive capacity; this effect will act cumulatively with historical and reasonably foreseeable in-water developments in the Marine RSA.
- Confidence: high – based on a good understanding of the historical changes to intertidal and subtidal habitats within the Marine RSA, a good understanding of the residual Project effects on Dungeness crab habitat, and a good understanding of the reasonably foreseeable developments that have the potential to affect the productive capacity of Dungeness crab habitat in the Marine RSA.

Cumulative Injury or Mortality of Dungeness Crab

Shoreline infilling and dredging activities during construction of the Westridge Marine Terminal are expected to contribute to a cumulative loss of a small number of Dungeness crabs, and this is considered to have a negative impact balance. A crab salvage program will be implemented whereby adult crabs are collected from within the Project Footprint using baited traps and relocated to a suitable area outside of the Marine Fish and Fish Habitat LSA. Salvages will be conducted immediately prior to the commencement of infilling and dredging so as to reduce the number of crabs that could potentially relocate to within the construction area. It is unknown whether Seaspan will implement a similar salvage program for their load-out pier project; however, the in-water footprint of the development is small (~1,720 m^2), suggesting that few Dungeness crabs will be harmed or killed during construction. Given the abundance of Dungeness crabs within the Marine RSA, the abundance of suitable Dungeness crab habitat, and with consideration of the mitigation measures that will be implemented to specifically reduce injury or mortality to this species, the Project's contribution to the cumulative effect of injury or mortality of Dungeness crabs is predicted to be of low magnitude (Table 8.12-2, point 3[b]). This cumulative effect is considered to be reversible in the medium-term, as Dungeness crabs spawn annually and any local reduction in abundance is expected to be restored within 1 to 2 years of spawning and recruitment. A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative injury or mortality of Dungeness crab is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to marine habitat loss may interact with historical and reasonably foreseeable developments within the Marine RSA to cause cumulative injury or mortality of Dungeness crab in the Marine RSA.
- Duration: short-term – the Project's contribution to cumulative injury or mortality of Dungeness crabs is limited to in-water construction activities at the Westridge Marine Terminal.

- Frequency: isolated – the Project's contribution to cumulative injury or mortality of Dungeness crabs will occur only during in-water works associated construction of the Westridge Marine Terminal.
- Reversibility: medium-term – a local reduction in the abundance of Dungeness crabs (*i.e.*, within the Project Footprint) is expected to be reversible within 1 to 2 years, as Dungeness crabs spawn and recruit on an annual basis.
- Magnitude: low – given the abundance of Dungeness crabs within Burrard Inlet, the loss of a relatively small number of individuals within the Project Footprint will not be detectable at the population level.
- Probability: high – construction of the Westridge Marine Terminal is likely to result in the loss of some Dungeness crabs, primarily juveniles that are too small to be captured and relocated by the proposed salvage program.
- Confidence: high – based on a good understanding of the in-water Project Footprint relative to the total available Dungeness crab habitat in the Marine RSA, a reasonable understanding of the distribution and abundance of Dungeness crabs in Burrard Inlet, and a good understanding of the reasonably foreseeable developments that have the potential to result in injury or mortality to Dungeness crab.

8.12.3.4 Marine Fish and Fish Habitat Indicator – Inshore Rockfish

Historical development in Burrard Inlet has likely reduced the availability of nearshore rocky habitat, resulting in a net decrease in the productive capacity of suitable habitat for inshore rockfish. However, the relatively low abundance of rockfish in Burrard Inlet and other developed areas of BC, including the Strait of Georgia, is primarily due to a history of overexploitation (Yamanaka and Logan 2010). The life history characteristics common to most rockfish, which include slow growth, late maturation and high site fidelity, make them particularly susceptible to rapid depletion in the face of heavy fishing pressure (Berkeley *et al.* 2004, Parker *et al.* 2000, Yamanaka and Logan 2010). The rockfish conservation area (RCA) located at the Westridge Marine Terminal is 1 of 164 such protected areas in BC, and is part of a broader conservation strategy for inshore rockfish (Yamanaka and Logan 2010).

Construction of the Westridge Marine Terminal will only temporarily diminish the productive capacity of inshore rockfish habitat. Once completed, the infill area will actually increase the availability of complex rocky habitat in the subtidal environment, and while the habitat is anthropogenic (riprap), it is expected to be of high value to species such as copper and quillback rockfish, which exhibit a strong preference for rocky substrates of high rugosity (Love *et al.* 2002). In addition, the implementation of a marine fish habitat compensation/offset program will ensure there is no net loss of productive capacity of inshore rockfish habitat. The preferred option for compensation/offsetting involves the construction of a series of subtidal rock reefs near the Westridge Marine Terminal, within the Eastern Burrard Inlet RCA. One of the primary objectives of this strategy would be to increase the availability and quality of rockfish habitat within the RCA.

Construction of the Seaspan load-out pier is not expected to result in a measurable effect on the productive capacity of inshore rockfish habitat. While a small amount of intertidal and subtidal riprap may be lost, most of the seafloor area affected is soft sediment, which has low value to most demersal rockfish species. In addition, the in-water footprint of the development (~1,720 m^2) is small and the affected habitat is in a highly industrialized area. Any loss of productive capacity resulting from construction of the load-out pier will be offset through fish habitat compensation/offsetting.

The Project's contribution to the cumulative decrease in productive capacity of suitable habitat for inshore rockfish is considered to have a negative impact balance. While rockfish abundance in Burrard Inlet is greatly reduced compared to historical levels, this is primarily due to a long history of overexploitation (Yamanaka and Logan 2010). With the implementation of a marine fish habitat compensation/offset program, the Project's contribution to the cumulative decrease in productive capacity of inshore rockfish habitat is predicted to be of low magnitude (Table 8.12-2, point 4[a]). This cumulative effect will be reversed once biotic communities have become fully established on the subtidal riprap and compensation/offset habitats, which is expected to take 2 to 3 years. A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on inshore rockfish is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to marine habitat loss may interact with historical and reasonably foreseeable developments within the Marine RSA to cause a cumulative decrease in the productive capacity of suitable habitat for inshore rockfish in the Marine RSA.
- Duration: short-term – Project activities at the Westridge Marine Terminal that have the potential to contribute to a cumulative decrease in productive capacity of suitable habitat for inshore rockfish are limited to the construction phase.
- Frequency: isolated – Project activities at the Westridge Marine Terminal that have the potential to contribute to a cumulative decrease in productive capacity of suitable habitat for inshore rockfish are confined to the construction phase.
- Reversibility: medium-term – implementation of a marine fish habitat compensation/offset program will ensure there is no net loss of the productive capacity of inshore rockfish habitat; full recovery of productive capacity may take 2 to 3 years following the installation of compensation/offsetting features.
- Magnitude: low – construction of the Westridge Marine Terminal will decrease the productive capacity of inshore rockfish habitat in only a small portion of the Marine RSA and this effect will be offset through the implementation of a marine fish habitat compensation/offset program.
- Probability: high – construction of the Westridge Marine Terminal will affect a small amount of existing rock (riprap) habitat resulting in a temporary decrease in productive capacity; this effect will act cumulatively with historical and reasonably foreseeable in-water developments in the Marine RSA.
- Confidence: high – based on a good understanding of the historical changes to intertidal and subtidal habitats within the Marine RSA, a good understanding of the residual Project effects on inshore rockfish habitat, and a good understanding of the reasonably foreseeable developments that have the potential to affect the productive capacity of inshore rockfish habitat in the Marine RSA.

8.12.3.5 Marine Fish and Fish Habitat Indicator – Pacific Salmon

Historical shoreline developments in Burrard Inlet, particularly in the Inner Harbour, have linearized much of the natural shoreline and replaced structurally complex habitats with riprap and retaining walls (Stantec 2009). This substantial habitat modification has reduced the productive capacity of Pacific salmon habitat within the Marine RSA, particularly for juveniles, which use nearshore habitats extensively for rearing prior to embarking on seaward migrations (Haggarty 2001).

Construction of the Westridge Marine Terminal will result in the loss of intertidal and subtidal habitats, and this will act cumulatively with the effects of historical developments in the Marine RSA. The Project-specific effects on the productive capacity of Pacific salmon habitat are, however, expected to be minimal. The shoreline within the Project Footprint is primarily anthropogenic and Project construction will effectively replace intertidal habitats like-for-like (*i.e.*, riprap with riprap). Nevertheless, the Project's contribution to the cumulative decrease in productive capacity of Pacific salmon habitat is considered to have a negative impact balance. The loss of productive capacity resulting from in-water construction activities will be offset through the implementation of a marine fish habitat compensation/offset program. The preferred option of subtidal rock reefs would provide high-value foraging and rearing habitat for juvenile salmon. The reefs would increase the structural complexity of nearshore habitats in the local area, enhance productivity (*i.e.*, algal growth) and increase prey availability for a variety of marine fish species, including Pacific salmon.

Construction of the Seaspan load-out pier may result in a small reduction in the productive capacity of Pacific salmon habitat; however, the small footprint of this development and the industrial nature of the site suggest that effects will be minimal. Similar to Trans Mountain, Seaspan will implement a fish habitat compensation/offset program to ensure there is no net loss of productive capacity of Pacific salmon habitat.

The cumulative effect of a decrease in the productive capacity of Pacific salmon habitat within the Marine RSA resulting from historical development, Project construction and reasonably foreseeable developments is predicted to be of medium magnitude. However, the major contributor to this effect is the legacy of industrial and urban development that has diminished the natural integrity of shoreline habitats throughout much of Burrard Inlet.

With the implementation of a marine fish habitat compensation/offset program, the Project's contribution to the cumulative decrease in productive capacity of Pacific salmon habitat is predicted to be of low magnitude (Table 8.12-2, point 5[a]). While the productive capacity of Pacific salmon habitat will be temporarily reduced as a result of Project construction, this cumulative effect will be reversed once biotic communities have become fully established on the intertidal and subtidal riprap and the compensation/offsetting habitats. A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on Pacific salmon is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to marine habitat loss may interact with historical and reasonably foreseeable developments within the Marine RSA to cause a cumulative decrease in the productive capacity of suitable habitat for Pacific salmon in the Marine RSA.
- Duration: short-term – Project activities at the Westridge Marine Terminal that have the potential to contribute to a cumulative decrease in productive capacity of suitable habitat for Pacific salmon are limited to the construction phase.
- Frequency: isolated – Project activities at the Westridge Marine Terminal that have the potential to contribute to a cumulative decrease in productive capacity of suitable habitat for Pacific salmon are confined to the construction phase.
- Reversibility: medium-term – implementation of a marine fish habitat compensation/offset program will ensure there is no net loss of the productive capacity of Pacific salmon; full recovery of productive capacity may take 2 to 3 years following the installation of compensation features.
- Magnitude: low – construction of the Westridge Marine Terminal will decrease the productive capacity of Pacific salmon habitat in only a small portion of the Marine RSA and this effect will be offset through the implementation of a marine fish habitat compensation program.
- Probability: high – construction of the Westridge Marine Terminal will affect intertidal and subtidal habitats used by Pacific salmon, primarily juveniles, resulting in a temporary decrease in productive capacity; this effect will act cumulatively with historical and reasonably foreseeable in-water developments in the Marine RSA.
- Confidence: high – based on a good understanding of the historical changes to intertidal and subtidal habitats within the Marine RSA, a good understanding of the residual Project effects on Pacific salmon habitat, and a good understanding of the reasonably foreseeable developments that have the potential to affect the productive capacity of Pacific salmon habitat in the Marine RSA.

8.12.3.6 Combined Cumulative Effects on Marine Fish and Fish Habitat

Over a century of development in Burrard Inlet has resulted in the modification of a substantial amount of shoreline habitat within the Marine RSA, as well as the infilling of a large area of subtidal habitat (Stantec 2009). These extensive changes to the Burrard Inlet marine ecosystem have undoubtedly reduced the productive capacity of fish habitat, with effects on a variety of marine organisms, including Dungeness crab, inshore rockfish and Pacific salmon. Natural shoreline habitats are still found in some areas of Burrard Inlet, particularly Indian Arm and to a lesser degree Port Moody Arm and the Central Harbour, and current best practices to manage project-specific effects will minimize additional loss of productive capacity of marine fish habitat.

Trans Mountain recognizes the ecological, economic and cultural importance of marine fish and their habitats, and is committed to minimizing adverse effects of the Project on the marine environment. Construction of the Westridge Marine Terminal will result in the loss of intertidal and subtidal habitat within the Project Footprint; however, the associated reduction of productive capacity will be offset through the implementation of a marine fish habitat compensation/offset program. This program will be developed in consultation with DFO, Aboriginal communities, local stewardship groups and other interested parties, and will ensure that there is 'no net loss' of the productive capacity of marine fish habitat. In fact, the goal of the compensation program will be to increase productive capacity so that the Project has a net benefit to marine fish and fish habitat.

Of the three reasonably foreseeable developments located within the Marine RSA, only the Seaspan Modernization Project involves in-water works that could affect marine fish and fish habitat. The footprint of the proposed load-out-pier is small (~1,720 m^2) and the site is heavily industrialized, suggesting that effects on marine fish and fish habitat will be minimal. However, like Trans Mountain, Seaspan will implement a fish habitat compensation program to ensure there is no net loss of the productive capacity of fish habitat.

In consideration of the history of development in the Marine RSA and the extensive changes to shoreline habitats, the combined cumulative effects of historical developments, Project construction, and reasonably foreseeable developments on marine fish and fish habitat are considered to be of medium magnitude.

With the implementation of a suite of mitigation measures designed to minimize adverse effects of the Project on marine fish and their habitats (see Section 7.6.9), the Project's contribution to combined cumulative effects on the marine fish and fish habitat indicators are predicted to be of low magnitude (Table 8.12-2, point 6[a]). A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on the marine fish and fish habitat indicators is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to marine habitat loss may interact with historical and reasonably foreseeable developments within the Marine RSA to cause combined cumulative effects on marine fish and fish habitat in the Marine RSA.
- Duration: short-term – Project activities at the Westridge Marine Terminal that have the potential to contribute to combined cumulative effects on marine fish and fish habitat are limited to the construction phase.
- Frequency: isolated – Project activities at the Westridge Marine Terminal that have the potential to contribute to combined cumulative effects on marine fish and fish habitat are confined to the construction phase.
- Reversibility: medium-term to permanent – while construction of the Westridge Marine Terminal will result in the permanent loss of some intertidal and subtidal habitat, implementation of a marine fish habitat compensation/offset program will ensure there is no net loss of the productive capacity of marine fish habitat.
- Magnitude: low – construction of the Westridge Marine Terminal will affect marine fish habitats in an area that has been previously modified by development (*i.e.*, most habitats are not natural); any and all losses of productive capacity will be offset through the implementation of a marine fish habitat compensation/offset program.
- Probability: high – construction of the Westridge Marine Terminal involves in-water works that will affect marine fish and fish habitat; these effects will act cumulatively with historical and reasonably foreseeable in-water developments in the Marine RSA.
- Confidence: high – based on a good understanding of the historical changes to marine fish habitats within the Marine RSA, a good understanding of the residual Project effects on marine fish and fish habitat, a good understanding of the effectiveness of habitat compensation/offsetting measures and a good understanding of the reasonably foreseeable developments that have the potential to affect marine fish and fish habitat in the Marine RSA.

8.12.4 Summary

As identified in Table 8.12-2, there are no situations where there is a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. Consequently, the Project's contribution to cumulative effects on marine fish and fish habitat within the Marine RSA will be not significant.

8.13 Marine Mammals

8.13.1 Reasonably Foreseeable Developments

Three certain and reasonably foreseeable developments are identified within the Marine RSA that were considered for the qualitative evaluation of cumulative effects on the marine mammals indicator: Neptune Terminals Coal Handling Infrastructure Upgrade and Expansion; Richardson International Grain Storage Capacity Expansion; and Seaspan Shipyard Modernization. These developments are further described in Section 8.1.4 and Table 8A.1-6 of Appendix 8.1. All three reasonably foreseeable developments are located in the Inner Harbour, west of the Second Narrows, and are distant from the Marine Mammals LSA.

The only Project that will involve in-water works is the Seaspan Shipyard Modernization. The other two projects (Neptune and Richardson) are limited to the construction and expansion of on-land infrastructure. The Seaspan project will produce underwater noise during construction. However, all three Projects will be completed by early 2015 and there will be no temporal overlap with construction of the Westridge Marine Terminal, which is scheduled to commence no earlier than September 2015.

8.13.2 Potential Cumulative Effects

The potential and likely environmental residual effects associated with construction of the Westridge Marine Terminal on the marine mammals indicator were identified in Section 7.11.1.13. As previously noted in Section 7.11.1.13, no pathways of effects to marine mammals associated with operational activities of the Westridge Marine Terminal were identified. Out of the three reasonably foreseeable developments identified in Section 8.1.4 above, only the Seaspan Shipyard Modernization Project is likely to result in residual effects on marine mammals. Given that there will be no temporal overlap between development of this project and construction of the Westridge Marine Terminal, it was determined that there is no potential for cumulative effects on marine mammals during the construction phase of the Project. Furthermore, operational activities at the Westridge Marine Terminal are not expected to affect marine mammals; therefore, there is no potential for cumulative effects during the operations phase of the Project.

8.14 Marine Birds

This subsection discusses how the Project could act in combination with existing activities and reasonably foreseeable developments to cumulatively affect marine bird indicators (*i.e.*, bald eagle, great blue heron, pelagic cormorant, Barrow's goldeneye, glaucous-winged gull and spotted sandpiper) that are anticipated to have an adverse combined Project-specific residual effect.

8.14.1 Reasonably Foreseeable Developments

Table 8A.1-6 of Appendix 8.1 provides a list of the reasonably foreseeable developments within BC and those located within the Marine RSA to be considered in the evaluation of cumulative effects on the Marine Bird indicators. There are three primary future developments located within the Marine RSA (Table 8.11-1) that would contribute to the cumulative effect of disturbance to marine birds from noise and activity during construction and operations: Neptune Bulk Terminals Ltd. Coal Handling Infrastructure Upgrade and Expansion Project; Richardson International Ltd. Grain Storage Capacity Project, and Seaspan Shipyard Modernization Project.

All three Projects are scheduled to be completed by spring 2015 and will have no temporal overlap with the construction of the Westridge Marine Terminal which is scheduled to commence no earlier than September 2015.

8.14.2 Potential Cumulative Effects

The three reasonably foreseeable Projects in Table 8.14-1 are scheduled to be completed prior to the onset of construction of the Westridge Marine Terminal on or after September 2015. Noise from construction of these projects will not be cumulative with noise from construction of the Westridge Marine Terminal. The cumulative effects assessment for the Westridge Marine Terminal will; therefore, only address the potential cumulative effect of disturbances during operations. Refer to Section 7.6.12 for a Project-specific assessment of potential effects associated with construction of the Westridge Marine Terminal on marine bird indicators.

One of the foreseeable developments will involve in-water construction; the load-out pier of the Seaspan Shipyard Modernization Project. With consideration for the extent of disturbance, commercial infrastructure and daily activity in the current terminal, it is unlikely that the inside docking areas are currently visited by seabirds, apart from gull species. The intertidal areas consist of non-productive substrate without vegetation, and there is limited value as a source of food for birds or fish prey. There are abundant opportunities for perching on the existing infrastructure which are not anticipated to change substantially after construction of the load-out pier. There is negligible potential for cumulative effects from loss of marine shoreline or intertidal habitat to marine birds, and this will not be assessed further.

The potential and likely combined environmental residual effects associated with the construction and operation of the Project on marine birds indicators were identified in Section 7.11.1.14 and are listed in Table 8.14-2 along with existing activities and reasonably foreseeable developments that could act in combination with the Project. Because there will not be cumulative effects associated with the risk of mortality or habitat loss, the cumulative effects assessment will consider only the potential for effects from the events of sensory disturbance.

TABLE 8.14-2

POTENTIAL RESIDUAL EFFECTS OF THE PROJECT ON MARINE BIRDS CONSIDERED FOR THE CUMULATIVE EFFECTS ASSESSMENT

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
1. Combined effects on bald eagle.	RSA	Westridge Marine Terminal	Operations	Project contribution to the cumulative effects of marine bird sensory disturbance in the form of stress, behavioural changes or avoidance of preferred or important habitats during operations.	• Existing activities including Marine Commercial, Recreational and Tourism Use. • Reasonably foreseeable developments within the RSA listed in Table 8A.1-6 of Appendix 8.1 and Project and non Project-related vessel traffic discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including noise, terminal activity, lights, vessel berthing/deberthing during operations.
2. Combined effects on great blue heron.	RSA	Westridge Marine Terminal	Operations	Project contribution to the cumulative effects of marine bird sensory disturbance in the form of stress, behavioural changes or avoidance of preferred or important habitats during operations.	• Existing activities including Marine Commercial, Recreational and Tourism Use. • Reasonably foreseeable developments within the RSA listed in Table 8A.1-6 of Appendix 8.1 and Project and non Project-related vessel traffic discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including noise, terminal activity, lights, vessel berthing/deberthing during operations.
3. Combined effects on pelagic cormorant.	RSA	Westridge Marine Terminal	Operations	Project contribution to the cumulative effects of marine bird sensory disturbance in the form of stress, behavioural changes or avoidance of preferred or important habitats during operations.	• Existing activities including Marine Commercial, Recreational and Tourism Use. • Reasonably foreseeable developments within the RSA listed in Table 8A.1-6 of Appendix 8.1 and Project and non Project-related vessel traffic discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including noise, terminal activity, lights, vessel berthing/deberthing during operations.

TABLE 8.14-2 Cont'd

Potential Residual Project Effect on Indicator	Spatial Boundary[1]	Project Component(s)	Temporal Boundary	Potential Cumulative Effect	Existing Activities/Reasonably Foreseeable Developments with Residual Effects Acting in Combination with the Project
4. Combined effects on Barrow's goldeneye.	RSA	Westridge Marine Terminal	Operations	Project contribution to the cumulative effects of marine bird sensory disturbance in the form of stress, behavioural changes or avoidance of preferred or important habitats during operations.	• Existing activities including Marine Commercial, Recreational and Tourism Use. • Reasonably foreseeable developments within the RSA listed in Table 8A.1-6 of Appendix 8.1 and Project and non Project-related vessel traffic discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including noise, terminal activity, lights, vessel berthing/deberthing during operations.
5. Combined effects on glaucous-winged gull.	RSA	Westridge Marine Terminal	Operations	Project contribution to the cumulative effects of marine bird sensory disturbance in the form of stress, behavioural changes or avoidance of preferred or important habitats during operations.	• Existing activities including Marine Commercial, Recreational and Tourism Use. • Reasonably foreseeable developments within the RSA listed in Table 8A.1-6 of Appendix 8.1 and Project and non Project-related vessel traffic discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including noise, terminal activity, lights, vessel berthing/deberthing during operations.
6. Combined effects on spotted sandpiper.	RSA	Westridge Marine Terminal	Operations	Project contribution to the cumulative effects of marine bird sensory disturbance in the form of stress, behavioural changes or avoidance of preferred or important habitats during operations.	• Existing activities including Marine Commercial, Recreational and Tourism Use. • Reasonably foreseeable developments within the RSA listed in Table 8A.1-6 of Appendix 8.1 and Project and non Project-related vessel traffic discussed in Section 8.1.4. • Project-related activities that could interact with the above activities including noise, terminal activity, lights, vessel berthing/deberthing during operations.

Note: 1 RSA = Marine RSA.

8.14.3 Significance Evaluation of Potential Cumulative Effects

The Project's contribution to cumulative effects from the Westridge Marine Terminal operations include potential sensory disturbances from an increase in terminal noise, human activity, night lights, vessel berthing/deberthing activities, maintenance and inspection during operations, increased vessel activities and other local marine activities (*e.g.*, recreational boating, fishing and shoreline use), and the consequent alteration of normal distribution and patterns of marine bird habitat use to avoid particular foreshore areas. Previous research indicates that marine birds are disturbed by in-air noise levels greater than 90 dB per 20 µPa (Gladwin *et al.* 1988). Given the current context of dense marine foreshore development in Burrard Inlet, marine birds have been known to habituate to noise levels under 90 dB and to other sensory disturbances, such as marine activity, night-lighting, and vessel berthing and unberthing events that are periodic, predictable and not adverse experiences (Grubb *et al.* 2002, Steidl and Anthony 2000, Ward and Stehn 1989). Terminal operations are unlikely to have a substantial contribution to cumulative effects in the Marine RSA considering the context of high volume activity and marine industry within their current habitats.

Where there are no standards, guidelines, objectives or other established and accepted ecological thresholds to define quantitative rating criteria, or where quantitative thresholds are not relevant to the Marine RSA, the qualitative method that is based on information and guidance provided from available research literature, and the professional judgment of the assessment team. This qualitative approach is considered to be the appropriate method for evaluating and determining the significance of the anticipated Project's contribution to cumulative environmental effects.

Table 8.14-3 provides a summary of the significance evaluation of the Project's contribution to potential cumulative effects on marine bird indicators. The rationale used to evaluate the significance of each of the cumulative effects is provided below.

TABLE 8.14-3

SIGNIFICANCE EVALUATION OF THE PROJECT'S CONTRIBUTION TO CUMULATIVE EFFECTS ON MARINE BIRDS

	Potential Cumulative Effects	Impact Balance	Spatial Boundary[1]	Temporal Context			Magnitude	Probability	Confidence	Significance[2]
				Duration	Frequency	Reversibility				
1.	Marine Bird Indicator – Bald Eagle									
1(a)	Project contribution to cumulative increase in stress, behavioural changes or avoidance of preferred or important habitats, which may adversely affect species fitness and population sustainability.	Negative	RSA	Long-term	Periodic	Short-term	Low	High	High	Not significant
2.	Marine Bird Indicator – Great Blue Heron									
2(a)	Project contribution to cumulative increase in stress, behavioural changes or avoidance of preferred or important habitats, which may adversely affect species fitness and population sustainability.	Negative	RSA	Long-term	Periodic	Short-term	Low	High	High	Not significant
3.	Marine Bird Indicator – Pelagic Cormorant									
3(a)	Project contribution to cumulative increase in stress, behavioural changes or avoidance of preferred or important habitats, which may adversely affect species fitness and population sustainability.	Negative	RSA	Long-term	Periodic	Short-term	Low	High	Moderate	Not significant
4.	Marine Bird Indicator – Barrow's Goldeneye									
4(a)	Project contribution to cumulative increase in stress, behavioural changes or avoidance of preferred or important habitats, which may adversely affect species fitness and population sustainability.	Negative	RSA	Long-term	Periodic	Short-term	Low	High	Moderate	Not significant
5.	Marine Bird Indicator – Glaucous-winged Gull									
5(a)	Project contribution to cumulative increase in stress, behavioural changes or avoidance of preferred or important habitats, which may adversely affect species fitness and population sustainability.	Negative	RSA	Long-term	Occasional	Short-term	Low	High	High	Not significant
6.	Marine Bird Indicator – Spotted Sandpiper									
6(a)	Project contribution to cumulative increase in stress, behavioural changes or avoidance of preferred or important habitats, which may adversely affect species fitness and population sustainability.	Negative	RSA	Long-term	Periodic	Short-term	Low	High	Moderate	Not significant
7.	Combined Cumulative Effects on Marine Birds									
7(a)	Project contribution to combined cumulative effects on the marine birds indicators (1[a] to 6[a]).	Negative	RSA	Long-term	Periodic	Short-term	Low	High	High	Not significant

Notes: 1 RSA = Marine RSA.

2 Significant Contribution to a Cumulative Environmental Effect: A high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated.

8.14.3.1 Marine Birds Indicator – Bald Eagle

The bald eagle is a resident avian predator that feeds opportunistically on fish, waterbirds, small mammals and carrion in shallow water and along shorelines, and represents other raptor species which may also be using these shoreline and foreshore habitats. There are approximately 15 breeding pairs of bald eagle within the Marine RSA; however, there are also many more non-breeding individuals present during the fall and winter months (Cook 2008) when bald eagles are less territorial. Increased in-air noise, night-lighting and activity at the Westridge Marine Terminal may cause some individuals to avoid using preferred and/or important seasonal foraging or breeding habitats. Bald eagles have been documented to habituate to noise and human activity in developed areas (Grubb *et al.* 2002, McGarigal *et al.* 1991). Although it is difficult to assess the level of habituation in birds that reside in Burrard Inlet, some habituation is likely in such a busy industrial and commercially developed port where many breeding pairs currently reside. It is reasonable to assume bald eagle persistence is related to some level of anthropogenic tolerance, and this can be said for other raptor or foreshore species that the bald eagle, as an indicator, is representative of, such as vultures, osprey, Cooper's hawk, owls or great blue herons.

The Project's contribution to cumulative effects within the Marine RSA resulting from expansion of the Westridge Marine Terminal is not expected to be substantial beyond the Marine Birds LSA, and will be relatively minor proportion of the effects from existing and foreseeable developments. The Project's contribution to cumulative effects with respect to the bald eagle is primarily of concern in the area of overlap between the breeding territory of a pair of bald eagles, local tree roosts and intertidal zones, and the Westridge Marine Terminal; however, may potentially include the effects of increased vessel activity in the Marine RSA as a whole. Sensory disturbance (*i.e.*, terminal-related in-air noise and activity, increased vessel activity) is considered to have a negative impact balance through the potential for bald eagle avoidance of preferred hunting/foraging foreshore habitats; however, vessel activity is unlikely to present much of a concern for disturbance in the typical shoreline habitats used by this group of species. The potential for long-term periodic disturbances near the terminal may affect a small number of individuals outside the breeding season when eagles are less territorial. It is unlikely that there will be an adverse effect to the regional population which is abundant and stable.

The Project's contribution to the cumulative effects on bald eagles from sensory disturbance events is anticipated to be associated with the terminal and increased Project-related vessel activities within the Marine RSA will be temporary events Recommended mitigation measures in Section 7.6.12 and the Westridge Marine Terminal EPP (Volume 6D) will be implemented to reduce the effects from sensory disturbances. Consequently, with consideration for the existing highly developed environment within the Marine RSA, the stable and abundant local and regional bald eagle population, the likelihood of some level of habituation to local disturbances, and the professional judgment of the assessment team, the Project's contribution to cumulative effects on bald eagle will occur over the long-term and to be of low magnitude and short-term reversibility (Table 8.14-3, point 1[a]). A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on bald eagles is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to cumulative effects are assessed within the regional context of the Marine RSA with consideration for resident territories of bald eagles.
- Duration: long-term – the events causing sensory disturbance to bald eagles is the contribution to the cumulative effect of repeated and regular Project-related disturbances during terminal and vessel operations for the life of the Project.
- Frequency: periodic – the events causing sensory disturbance to bald eagles is the contribution to the cumulative effect of Project–related terminal and increased vessel activities occurring intermittently but repeatedly throughout the life of the Project.
- Reversibility: short-term – the cumulative effect of Project-related disturbances to bald eagles will be reversible shortly after each disturbance event.
- Magnitude: low – the effects from the Project will be detectable at the individual level but marginal on the bald eagle population in consideration of the high-volume of existing commercial and industrial activity in the Marine RSA and the potential for individual levels of habituation to disturbance.

- Probability: high – the Project is likely to contribute to the cumulative effect of increased sensory disturbances to bald eagles.
- Confidence: high – based on a good understanding by the assessment team of cause-effect relationships between Project-related and local development activities and bald eagles using data specific to the Marine RSA.

8.14.3.2 Marine Birds Indicator – Great Blue Heron

Great blue herons nest colonially in woodland forest. Stanley Park, which extends to the shoreline of the Marine RSA, has a large active nesting colony. A small colony of a few breeding pairs is also located upstream of the Westridge Marine Terminal site in the riparian zone of Heron Creek. The indicator, great blue heron, forages opportunistically on fish, small mammal and invertebrate prey primarily taken within the intertidal zone and, as such, represent the many species of intertidal foragers that occur within the Marine RSA (*e.g.*, sandpiper species, waterfowl species, common raven, migrating birds). Increased noise and activity during terminal and shipping operations could potentially result in the avoidance by some individuals of preferred foraging habitats at foreshore areas (Gebauer and Moul 2001, Vennesland 2000) or local perches in trees or on terminal structures. Extended or high-level disturbance events, such as loud maintenance activity, short-term construction projects, or safety alarms could cause stress in some individuals depending on their degree of prior exposure to noises or terminal-related activities (Carney and Sydeman 1999, 2000). Because primary habitat use is foreshore-based, it is unlikely that increased vessel activity from the Project or other foreseeable developments will present more than a marginal potential for sensory disruptions. Recent scientific literature documents the sensitivities of great blue heron colonies to various sources and types of disturbance (Carney and Sydeman 1999, 2000, Vennesland 2000), the seriousness of which is often dependent on the existing environmental conditions and the familiarity of natal colonies to these disturbances prior to their occurrence. However, habituation has been observed in some population groups (Vennesland 2000), again dependent on local conditions at breeding colonies and natal rearing sites. Operational noise from the terminal is unlikely to extend substantially beyond the Marine Birds LSA, although, unusual or loud vessel activities may occur anywhere within the Marine RSA. The establishment of mitigation measures provided in the Westridge Marine Terminal EPP (Volume 6D) will reduce or avoid potential future noise disturbances to marine life.

The Project's contribution to cumulative effects overall within the Marine RSA will be a relatively minor proportion of the effects from existing activities and reasonably foreseeable developments. The Project's contribution to cumulative effects with respect to the indicator, great blue heron, and other represented species, is concerned with the area of overlap between high suitability foraging sites in shallow areas, and forest or structural roosting sites within the Marine Bird LSA and the Marine RSA. Sensory disturbance (*i.e.*, terminal-related in-air noise and activity, increased vessel activity) is considered to have a negative impact balance by causing marine bird avoidance of preferred foraging habitats. The potential for long-term periodic disturbances, because they are primarily associated with nightly lighting of the terminal, scheduled docking and filling operations, and associated worker activities near the terminal, and 24-hour potential disturbances from increased marine vessel activity, will affect a small number of individuals, both adults and juveniles that have dispersed within the Marine RSA. There is unlikely to be an adverse effect to the regional breeding population because noise will be mitigated through measures established in the Westridge Marine Terminal EPP (Volume 6D), and the breeding colonies are distant enough from the terminal to presume there is likely to be no effect from sensory disturbance.

The Project's contributions to cumulative effects on great blue heron within the Marine RSA from increased sensory disturbance are anticipated to be associated with the terminal and increased Project-related vessel activities, and will be temporary events lasting for a limited time period. Recommended mitigation measures in Section 7.6.12 and the Westridge Marine Terminal EPP (Volume 6D) will be implemented to reduce events of sensory disturbance during operations. Consequently, with consideration for the existing highly developed environment within the Marine RSA, the potential for the local breeding population of great blue herons to have some level of habituation, and the professional judgment of the assessment team, the Project's contribution to cumulative effects on great blue herons is considered long-term in duration, to be of low magnitude effect and of short-term reversibility (Table 8.14-3, point 2[a]). A summary of the rationale for all of the significance criteria for the Project's contribution to cumulative effects on great blue herons is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to cumulative effects are assessed within the regional context of the Marine RSA with consideration for resident breeding territories of the great blue heron.
- Duration: long-term – the events causing sensory disturbance to great blue herons is the Project's contribution to the cumulative effect of repeated and regular Project-related disturbances during operations for the life of the Project.
- Frequency: periodic – the events causing sensory disturbance to great blue herons is the Project's contribution to the cumulative effect of terminal and increased vessel activities occurring intermittently but repeatedly throughout the life of the Project.
- Reversibility: short-term – the cumulative effect of Project-related disturbances to great blue herons will be reversible shortly after each disturbance event.
- Magnitude: low – the cumulative effects directly related to the Project will be detectable at the individual level but low on the regional population in consideration of the high-volume of existing commercial and industrial activity in the Marine RSA, and with consideration for some potential individual habituation to disturbance.
- Probability: high – the Project is likely to contribute to the cumulative effect of increased sensory disturbances to great blue herons.
- Confidence: high – based on a good understanding by the assessment team of cause-effect relationships between the Project-related activities and great blue herons, and using data specific to the Marine RSA.

8.14.3.3 Marine Birds Indicator – Pelagic Cormorant

Several pelagic cormorant breeding colonies are located within the Marine RSA on rocky islets and bridge structures (Moul and Gebauer 2002). Pelagic cormorants prey on fish within the littoral-benthic zone, including the nearshore areas of the Westridge Marine Terminal and within the Marine RSA. Increased terminal and vessel activity in the overall Marine RSA could potentially disturb individuals using preferred open water and foreshore areas to feed, and/or rocky shorelines and terminal structures to perch and preen. Pelagic cormorants are considered particularly sensitive to boats with a low disturbance threshold to human activities in less disturbed and more natural habitats (Carney and Sydeman 1999, 2000). This species, as an indicator, represents other larger piscivoruous and typically sensitive marine birds that occur within the Marine RSA, such as western grebes and common loons. Habituation is known to occur in some species of marine birds, such as bald eagles and glaucous-winged gulls, and cormorants often take advantage of man-made structures to rest and nest; however, the species represented, such as western grebes are unlikely to be habituated and, in fact, have substantially decreased in local population numbers. Although it is difficult to assess the level of habituation in groups that reside in Burrard Inlet without site-specific research and monitoring efforts; habituation might be assumed for cormorant species that reside in such a busy industrial and commercially developed port where many pairs currently breed.

The Project's contribution to cumulative effects will be a relatively minor proportion of the effects from Project-related and other reasonable foreseeable operations. The Project's contribution to cumulative effects with respect to the pelagic cormorant is concerned with the suitable preening and foraging sites in and near to the terminal and within the larger Marine RSA. Sensory disturbances (*i.e.*, terminal-related in-air noise and activity, and increased vessel activity) are considered to have a negative impact balance through pelagic cormorant avoidance of preferred foraging and roosting habitats. The potential for long-term periodic disturbances is greatest near the Westridge Marine Terminal and will affect a small number of individuals distributed within the eastern portion of the Marine RSA. There is unlikely to be an adverse effect to the regional breeding population because noise levels will be mitigated through established measures provided in the Westridge Marine Terminal EPP (Volume 6D) and will be attenuated with increasing distance between the terminal and breeding colonies that are greater than 5 km from the terminal. In addition, new berths that will be constructed as a part of terminal expansion will provide increased long-term substrates for the re-establishment of benthic invertebrates and vegetation.

The Project's contribution to cumulative effects on pelagic cormorant from increased sensory disturbances is anticipated to be associated with the terminal and increased Project-related vessel traffic, will be temporary events lasting for a limited time period. Recommended mitigation measures in Section 7.6.12 and the Westridge Marine Terminal EPP (Volume 6D) will be implemented to reduce the effects from operations. Adherence to established mitigation measures will reduce or avoid effects to marine life during operation of the Westridge Marine Terminal and associated increased vessel traffic. Consequently, with consideration for the context of the dynamic and highly developed environment of the Marine RSA, the potential for some level of pelagic cormorant habituation to industrial activities, the potential for increased opportunistic use of man-made structures to perch and nest, and the professional judgment of the assessment team, the Project's contribution to cumulative effects on pelagic cormorants will occur over the long-term and be of low magnitude effect and short-term reversibility (Table 8.14-3, point 3[a]). A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on pelagic cormorants is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to cumulative effects are assessed within the regional context of the Marine RSA with consideration for resident breeding territories of the pelagic cormorant.
- Duration: long-term – the events causing sensory disturbance to pelagic cormorant is the Project's contribution to the cumulative effect of repeated and regular Project-related disturbances during operations for the life of the Project.
- Frequency: periodic – the events causing sensory disturbance to pelagic cormorants is the Project's contribution to the cumulative effect of terminal and increased vessel activities occurring intermittently but repeatedly throughout the life of the Project.
- Reversibility: short-term – the cumulative effect of Project-related disturbances to pelagic cormorant will be reversible shortly after each disturbance event.
- Magnitude: low – the Project's contribution to cumulative effects will be detectable at the individual level but marginal on the population in consideration of the high-volume of existing commercial and industrial activity in the Marine RSA and consideration for potential individual habituation to disturbance.
- Probability: high – the Project is likely to contribute to the cumulative effect of increased sensory disturbances to pelagic cormorants.
- Confidence: moderate – based on a good understanding by the assessment team of cause-effect relationships between marine activities and pelagic cormorants but without sufficient data specific to the Marine RSA.

8.14.3.4 Marine Birds Indicator – Barrow's Goldeneye

Barrow's goldeneyes overwinter in the inlets and harbours of the Marine RSA using rocky shores to preen and rest. In subtidal areas, they feed on crustaceans and fish eggs. As such, they are indicators representing other resident and migrating marine birds that are benthic and invertebrate foragers within the Marine RSA, such as, surf scoters, common goldeneye and some waterfowl species. The existing Westridge Marine Terminal pilings provide a substrate for invertebrate prey. Increased in-air noise and activity at the terminal may disturb individuals that normally use these wharf habitats resulting in avoidance of preferred subtidal zones (Carney and Sydeman 1999, 2000) and consequent loss of foraging opportunities. Habituation is not common in seabird species, especially those that tend to use particular areas seasonally, such as goldeneye, alcids and other migratory species, and it is difficult to determine the potential for individual levels of habituation without site-specific monitoring. Constraints from obtaining important seasonal food requirements can result in reduced habitat effectiveness, energy budget constraints, and reduced individual fitness. The potential for long-term periodic disturbances from terminal activities and increased vessel operations will affect a seasonal number of individuals using the Marine RSA, especially at or near the terminal, and moving to and from preferred sheltered habitats in Indian Arm and Port Moody Arm. Noise and physical disturbances will attenuate with increase in distance of foraging birds, or rafts of birds, from the Westridge Marine Terminal and the central inlet.

The Project's contribution to cumulative effects within and near the Marine RSA will be a relatively minor proportion of the effects from marine activity associated with Project-related and other reasonably foreseeable marine terminal and vessel operations. The Project's contribution to cumulative effects with respect to the Barrow's goldeneye is concerned with suitable foraging and preening sites, primarily in and near the Marine Birds LSA but may extend to the Marine RSA with loud or unusual vessel activity. In-air noise and activity will potentially result in a negative impact balance through the avoidance of Barrow's goldeneye from productive nearshore foraging habitats. The potential for long-term periodic disturbances within the Marine RSA will affect a small number of individuals present on a seasonal basis (*i.e.,* overwintering); however, foraging capacity may improve over the life of the Project with the re-establishment of new benthic invertebrates, bi-valve populations and vegetation attached to the newly constructed wharfs.

The Project's contributions to cumulative effects on Barrow's goldeneye from increased sensory disturbance are anticipated to be associated with the terminal and increased Project-related vessel traffic and will be temporary events, lasting for a limited time period. Recommended mitigation measures in Section 7.6.12 and the Westridge Marine Terminal EPP (Volume 6D) will be implemented to reduce the effects from operations. Consequently, with consideration for the context of the highly developed environment of the Marine RSA, the potential for seasonal familiarity and some individual habituation to urban activity in overwintering areas, and the professional judgment of the assessment team, the Project's contribution to cumulative effects on Barrow's goldeneye will occur over the long-term and be of low magnitude effect and short-term reversibility (Table 8.14-3, point 4[a]). A summary of the rationale for all of the significance criteria for the Project's contribution to cumulative effects on Barrow's goldeneyes is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to cumulative effects are assessed within the regional context of the Marine RSA with consideration for preferred, seasonal, high suitability foraging habitats of the Barrow's goldeneye.
- Duration: long-term – the events causing sensory disturbance to Barrow's goldeneye is the Project's contribution to the cumulative effect of repeated and regular Project-related disturbances during operations for the life of the Project.
- Frequency: periodic – the events causing sensory disturbance to Barrow's goldeneye is the Project's contribution to the cumulative effect of terminal and increased vessel activities occurring intermittently but repeatedly throughout the life of the Project.
- Reversibility: short-term – the cumulative effect of Project-related disturbances to Barrow's goldeneye will be reversible shortly after each disturbance event.
- Magnitude: low – the Project's contribution to cumulative effects will be detectable at the individual level but negligible on the population in consideration of the high-volume of existing commercial and industrial activity in the Marine RSA and seasonal use by Barrow's goldeneyes.
- Probability: high – the Project is likely to contribute to the cumulative effect of increased sensory disturbances to Barrow's goldeneye.
- Confidence: moderate – based on a good understanding by the assessment team of cause-effect relationships between the Project activities and Barrow's goldeneye, without data pertinent to the Marine RSA and the potential for some individual familiarity with local disturbances.

8.14.3.5 Marine Birds Indicator – Glaucous-Winged Gull

An abundant population of glaucous-winged gulls opportunistically fish and scavenge within the marine and upland environments of the Marine RSA (Suraci and Dill 2011). There are several breeding colonies present within the Marine RSA including a site within 1 km of the Westridge Marine Terminal on the south shore of Port Moody Arm. Man-made commercial structures including the existing terminal pilings and berths currently provide shelter and roosting habitat which may later be enhanced by new wharf structures added during the expansion of the Westridge Marine Terminal. Glaucous-winged gulls are indicators of a wide range of other marine birds that forage and nest within the Marine RSA due their versatile habitat use and strong-association with human-influenced environments, and as in other species, their sensitivity during the breeding cycle, particularly during egg-laying and incubation.

Increased in-air noise, human activity, night-lighting and increased vessel movements may result in disturbance to individuals using these open water or shoreline habitats; however, for this species, habituation to anthropogenic disturbances is common and reasonable to assume in the urban and industrially developed context of marine habitats of Burrard Inlet. The Westridge Marine Terminal EPP (Volume 6D) has been developed to employ mitigation measures to avoid disturbance to marine life and includes consideration for sensitive wildlife periods (*i.e.*, the breeding period of glaucous-winged gulls from early May to late August at local breeding colonies). Noise levels capable of disturbing nesting birds will decrease with the distance of the nest sites from the source and are not expected to extend much beyond the Marine Birds LSA.

The Project's contribution to cumulative effects on glaucous-winged gulls within the Marine RSA will be a relatively minor proportion of the effects from combined sensory disturbance. The Project's contributions to cumulative effects on glaucous-winged gulls are anticipated to be associated with the terminal and increased Project-related vessel activity, and will be temporary events. Recommended mitigation measures in Section 7.6.12 and the Westridge Marine Terminal EPP (Volume 6D) will be implemented to reduce the effects from operations. Consequently, with consideration for the context of the highly developed environment of the Marine RSA, the likelihood of habituation and opportunistic advantages to gulls provided by urban developed marine areas, and the professional judgment of the assessment team, the Project's contribution to cumulative effects on glaucous-winged gulls will occur over the long-term and be of low magnitude effect and short-term reversibility (Table 8.14-3, point 5[a]). A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on glaucous-winged gulls is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to cumulative effects are assessed within the regional context of the Marine RSA with consideration for resident breeding territories of the glaucous-winged gull.
- Duration: long-term – the events causing sensory disturbance to glaucous-winged gulls is the Project's contribution to the cumulative effect of repeated and regular Project-related disturbances during operations for the life of the Project.
- Frequency: occasional – the events causing sensory disturbance to glaucous-winged gulls is the Project's contribution to the cumulative effect of terminal and increased vessel activities occurring intermittently and sporadically throughout the life of the Project.
- Reversibility: short-term – the cumulative effect of Project-related disturbances to glaucous-winged gulls will be reversible shortly after each disturbance event.
- Magnitude: low – the Project's contribution to cumulative effects will be detectable at the individual level but negligible to the population in consideration of the high-volume of existing commercial and industrial activity in the Marine RSA, the known anthropogenic association between gulls and human-influenced habitats, and the adherence to appropriate mitigation measures at the terminal.
- Probability: high – the Project is likely to contribute to the cumulative effects of increased sensory disturbances to glaucous-winged gulls.
- Confidence: high – based on a good understanding by the assessment team of cause-effect relationships between the Project activities and glaucous-winged gulls, the likelihood of some level of individual habituation to disturbance, and data pertinent to the Marine RSA.

8.14.3.6 Marine Birds Indicator – Spotted Sandpiper

Spotted sandpipers use a variety of aquatic habitats, nesting at shores under herbaceous ground cover and using mudflats, beaches, and breakwaters where they forage exclusively on invertebrates. The local population of spotted sandpipers is highest during migration and recent literature indicates the regional breeding population is stable (Gratto-Trevor *et al.* 2010). Like other sandpipers, they tend to flush easily during human disturbance events. Spotted sandpipers are indicators of a diversity of small and large migratory sandpiper species, and resident passerines (such as song sparrows), which use the intertidal and foreshore areas seasonally to forage on insects and other invertebrates, and to nest in shoreline vegetation, nest boxes (such as Purple martin) and debris. The additional in-air noise, light and activity at the Westridge Marine Terminal and the increased vessel activity during operations may stress individuals that are using preferred and/or important intertidal habitats to forage and upland shoreline habitats for breeding and nesting. Continued disturbance events may result in an alteration of patterns of habitat use to avoid those disturbed areas, and/or alterations to critical energy budgets during the breeding season. Noise or unusual activity at the terminal may have some measureable adverse effect on spotted sandpipers which as a bird group tend to be reactive to non-natural environmental inputs. Levels of habituation are not very well understood in this species. Disturbance can adversely affect habitat effectiveness, alter energy budgets and reduce individual fitness (Carney and Sydeman 1999, 2000). No nests have been documented at the shoreline or within the Westridge Marine Terminal footprint to-date; however, new nests can be initiated at any suitable location each year. The Westridge Marine Terminal EPP (Volume 6D) has been developed to reduce or eliminate potential harm or disturbance to marine life during operations to include environmental monitoring for wildlife and consideration of sensitive wildlife breeding periods. Noise and activity are not expected to extend much beyond the Marine Birds LSA.

The Project's contribution to cumulative effects on spotted sandpipers within the Marine RSA is expected to be a relatively minor proportion of total combined effects. However, habitat use is primarily in intertidal and shoreline areas; therefore, vessel activity is likely to be less of a concern except during unusual or loud activities. The Project's contributions to cumulative effects on spotted sandpipers are anticipated to be associated with the terminal and increased Project-related vessels, and disturbance events will be temporary. Recommended mitigation measures in Section 7.6.12 and the Westridge Marine Terminal EPP (Volume 6D) will be implemented to reduce the effects from operations. Consequently, with consideration for the context of the highly developed environment of the Marine RSA, seasonal breeding within the upper reaches of the Marine RSA, and the professional judgment of the assessment team, the Project's contribution to cumulative effects on spotted sandpipers will occur over the long-term and be of low magnitude effect and short-term reversibility (Table 8.14-3, point 6[a]). A summary of the rationale for all of the significance criteria of the Project's contribution to cumulative effects on spotted sandpipers is provided below.

- Spatial Boundary: Marine RSA – the Project's contribution to cumulative effects are assessed within the regional context of the Marine RSA with consideration for resident and migrating spotted sandpipers.
- Duration: long-term – the events causing sensory disturbance to spotted sandpipers is the Project's contribution to the cumulative effect of repeated and regular Project-related terminal and increased vessel activities during operations for the life of the Project.
- Frequency: periodic – the events causing sensory disturbance to spotted sandpipers is the Project's contribution to the cumulative effect of terminal and increased vessel activities occurring intermittently but repeatedly throughout the life of the Project.
- Reversibility: short-term – the cumulative effect of Project-related disturbances to spotted sandpipers will be reversible shortly after each disturbance event.
- Magnitude: low – the Project's contribution to cumulative effects will be detectable at the individual level but anticipated to be low on the population in consideration of the high-volume of existing commercial and industrial activity in the Marine RSA, and potential seasonable breeding within the Marine Birds LSA.
- Probability: high – the Project is likely to contribute to the cumulative effects of increased sensory disturbances to spotted sandpipers.
- Confidence: moderate – based on a good understanding by the assessment team of cause-effect relationships between marine activities and spotted sandpiper, sensitivity to disturbance events but without sufficient data specific to the Marine RSA.

8.14.3.7 Combined Effects on Marine Birds

The evaluation of the Project's contribution to the combined cumulative effects on the marine birds indicators from expansion of the Westridge Marine Terminal and increased Project-related vessels considers collectively the likelihood of potential residual effects on the following indicator species: bald eagle; great blue heron; pelagic cormorant; Barrow's goldeneye; glaucous-winged gull; and spotted sandpiper, and the larger diverse group of marine bird ecological guilds they represent. The potential Project-related cumulative effects are associated with sensory disturbance and consequent stress, behavioural alteration or changes in energy budget in each indicator. The potential cumulative effects of noise, human-activity, night-lighting, unusual events and increased vessel berthing/deberthing and movements within the Marine RSA may act in combination to affect marine birds as described above for each of the marine birds indicator species.

The potential impact balance to marine birds is considered negative. The implementation of mitigation measures described in Section 7.0 and the Westridge Marine Terminal EPP (Volume 6D) will reduce the severity of Project's contribution to cumulative effects arising from the Project and reasonably foreseeable developments. Burrard Inlet is one of the busiest ports on the Pacific Coast and effects are considered in the context of existing and predicted future high-volume industrial and commercial terminal and vessel activity within the Marine RSA, and the Project's modest contribution to that activity. The evaluation of effects takes into account that there is strict adherence to an existing regulatory framework for marine shipping operations. The combined contribution to cumulative effects on marine birds from the Project-related activities is considered to be of low magnitude, reversible in the short-term and of high probability (Table 8.14-3, point 7[a]). A summary of the rationale for all the significance criteria of the Project's contribution to cumulative effects on marine bird indicators is provided below.

- Spatial Boundary: Marine RSA – combined Project-related contribution to cumulative effects on marine birds are assessed within the context of projected future marine activities interacting with Project-related activities in the Marine RSA.
- Duration: long-term – the events causing the combined Project-related contribution to cumulative effects on marine birds will occur during operations for the life of the Project.
- Frequency: periodic – the events causing sensory disturbance to marine birds is the combined Project-related contribution to cumulative effects of the repeated and regular terminal and increased vessel activities which will occur intermittently for the life of the Project.
- Reversibility: short-term – the combined Project-related contribution to cumulative effects from sensory disturbance causing behavioural alterations will be reversible shortly after each disturbance event.
- Magnitude: low – the combined Project-related contribution to cumulative effects will be detectable at the individual level and may have low to negligible effects on populations, particularly during sensitive breeding periods, in consideration of the high-volume of existing marine activity and extent of shoreline development that currently exists within the Marine RSA, and some level of individual habituation to disturbance.
- Probability: high – the Project is likely to contribute to combined adverse cumulative effects on marine birds from sensory disturbance to varying degrees, during some energetically taxing seasons, such as migration or breeding, and under some environmental conditions.
- Confidence: high – based on a good understanding by the assessment team on pathways of cumulative effect between the increased Project-related activities and marine birds, and with data relevant to the Marine RSA.

8.14.4 Summary

As identified in Table 8.14-3, there are no situations where there is a high probability of the occurrence of a permanent or long-term residual cumulative effect of high magnitude on marine birds from the Project.

Consequently, it is concluded that the Project's contribution to the cumulative effects of the Project on marine birds in the Marine RSA will be not significant.

8.15 Marine Species at Risk

As discussed in Section 7.6.13, potential effects of the Project on marine species at risk are assessed through the use of indicators in Section 7.6.9 Marine Fish and Fish Habitat and Section 7.6.12 Marine Birds. Consequently, the cumulative effects assessment on combined effects of the Project on indicator species at risk is conducted in Section 8.12 Marine Fish and Fish Habitat and Section 8.14 Marine Birds.

Similar to Section 7.0, although not all species at risk are discussed explicitly under each indicator, potential cumulative effects were assessed in consideration of all species at risk. The indicators used to represent marine fish and fish habitat and marine birds were carefully selected to ensure that the full range of potential Project effects and Project contribution to cumulative effects on marine species at risk was addressed and mitigation measures to reduce these effects will apply to all marine species at risk, not just the indicators. Sections 8.12 Marine Fish and Fish Habitat and Section 8.14 Marine Birds provide the significance rationale for applicable indicator species. No significant adverse cumulative effects on marine species at risk have been identified as a result of the pipeline and facilities component of the Project.

8.16 Summary of the Assessment of Potential Cumulative Effects

An evaluation of the significance of the Project's contribution to cumulative effects was conducted for each indicator determined to have a likely combined residual effect associated with the Project, as identified in Section 7.11. Furthermore, an evaluation of the significance of the Project's contribution to cumulative effects was also conducted for each element where more than one likely cumulative effect may act in combination.

The cumulative effects assessment followed a standard approach for each likely combined residual effect associated with the Project. Effects resulting from existing activities and predicted for reasonably foreseeable developments were considered individually and in combination with those associated with the Project. Existing activities that have contributed to cumulative effects include agriculture and livestock grazing, forestry, rural and urban residential and commercial development, transportation and infrastructure development, utilities activities, oil and gas exploration and development and mineral resource exploration and development. Reasonably foreseeable developments that could contribute to cumulative effects include oil and gas developments (predominantly in Alberta), hydroelectric developments (in BC), transmission line developments, mining developments, transportation and infrastructure developments, utility activities, and marine developments and activities. Overall, the cumulative environmental effects associated with the construction and operation of the Project are similar to those routinely encountered during pipeline and facility construction in western Canada.

A number of potential cumulative effects associated with the following environmental elements were identified:

- physical elements such as soils and soil productivity, water quality and quantity, air emissions and acoustic environment;
- biological elements such as fish and fish habitat, wetland loss or alteration, vegetation, wildlife and wildlife habitat, and species at risk; and
- marine elements such as marine sediment and water quality, marine fish and fish habitat, marine birds and marine species at risk.

No potential cumulative effects were identified for marine mammals indicators since it was determined that there were no reasonably foreseeable developments that could act in combination with the Project to affect marine mammals in the Marine RSA.

The Project's contribution to a cumulative environmental effect is considered significant if the contribution is predicted to have a high probability of occurrence of a permanent or long-term cumulative effect of high magnitude that cannot be technically or economically mitigated. As identified in this cumulative effects assessment, with the implementation of mitigation measures in Section 7.0 and the Pipeline, Facilities and Westridge Marine Terminal EPPs (Volumes 6B, 6C and 6D), the Project's contribution to cumulative effects on the environmental indicators for the pipeline and facilities component of the Project is considered to be not significant.

REASONABLY FORESEEABLE DEVELOPMENTS

TABLE 8A.1-1

REASONABLY FORESEEABLE DEVELOPMENTS (MAPPED)

Mapping Number	Title	Location	Proponent	Type	Application Status	Description	Capital Cost	Construction Schedule	Element LSA or RSA	Sources
EDMONTON TO HINTON SEGMENT										
Proposed Pipeline Developments										
1	ACCESS Northeast Pipeline Expansion	Conklin area to Redwater area	ACCESS Pipeline Inc.	Oil Pipeline	Under review (ERCB application submitted June 15, 2012)	Proposed approximately 295 km 1,067 mm low vapour pressure bitumen blend pipeline from a pump station near Conklin at 1-16-77-5 W4M to the existing ACCESS Sturgeon Terminal at 4-18-56-21 W4M.	$1 billion	In-service by early 2015	Aquatics/ Wetland RSA	AER Application #1724272: website: http://www.ercb.ca/applications-and-hearings/notices/2012/1724272 ACCESS Northeast Pipeline Expansion website: http://accessexpansion.com/ Project Information Package: http://accessexpansion.com/docs/Access-Northeast-Expansion-Project-Information.pdf
2	Alberta Carbon Trunk Line	Near Fort Saskatchewan, Alberta to southeast of Lacombe	Enhance Energy Inc.	CO_2 Pipeline	Approved	A large-scale CO_2 enhanced oil recovery and storage project Near Fort Saskatchewan, Alberta to southeast of Lacombe.	$ unknown	Currently under construction, in-service by late 2013	Aquatics/ Wetland RSA	Enhance Energy Inc. website: http://www.enhanceenergy.com/actl
3	Edmonton to Hardisty Pipeline Project	Edmonton to Hardisty	Enbridge Pipelines Inc.	Oil Pipeline	Under review (NEB application submitted December 14, 2012)	A proposed 181 km new 914.4 mm (NPS 36) crude oil pipeline from the existing Enbridge Edmonton Terminal to the existing Enbridge Hardisty Terminal. The proposed pipeline right-of-way will be alongside and contiguous to an existing Enbridge pipeline right-of-way and other linear disturbances for approximately 96.6% of its length.	$286 million	Construction from Q3 2014 to Q1 2015	Air Quality RSA Aquatics/ Wetland RSA Acoustic RSA Soil LSA Vegetation RSA Wildlife RSA	NEB website: http://www.neb-one.gc.ca/clf-nsi/rthnb/pplctnsbfrthnb/nbrdgdmntnhrdsty/nbrdgdmntnhrdsty-eng.html#s1 Enbridge – Edmonton to Hardisty Pipeline Project website: http://www.enbridge.com/EdmontonHardistyPipeline.aspx
4	Grand Rapids Pipeline Project	Fort McMurray to Edmonton	TransCanada PipeLines Ltd. (Grand Rapids Pipeline GP Ltd.)	Oil and Diluent Pipeline	Under review (ERCB application submitted May 23, 2013)	Proposed pipeline project that includes both a crude oil and a diluent line to transport volumes approximately 500 km between the producing area northwest of Fort McMurray and the Edmonton / Heartland region.	$3 billion	Construction from summer 2014 to early 2017	Air Quality RSA Aquatics/ Wetland RSA Acoustic RSA Soil LSA Vegetation RSA Wildlife RSA	AER website: https://www3.eub.gov.ab.ca/eub/dds/iar_query/ApplicationAttachments.aspx?AppNumber=1763130 TransCanada PipeLines Ltd. website: http://www.transcanada.com/grand-rapids.html March 2013 – Project Update: http://www.transcanada.com/docs/Key_Projects/Grand-Rapids-Project-Update.pdf Right- of-way: https://www3.eub.gov.ab.ca/eub/dds/iar_query/ApplicationAttachments.aspx?AppNumber=1763130
5	Heartland Pipeline and TC Terminals Projects	Fort Saskatchewan to Hardisty	TransCanada PipeLines Ltd. (Heartland Pipeline GP Ltd. and TC Terminals GP Ltd.)	Oil Pipeline and Tank Storage Facility	Pre-application (AER filing planned in Q3 2013)	Split into two separate projects: a proposed approximately 200 km 914 mm (NPS 36) crude oil pipeline extending from 13 km northeast of Fort Saskatchewan to 7 km south of Hardisty, also entailing the construction of two pump stations; and a proposed tank storage facility near Fort Saskatchewan at SW/SE 28-55-21 W4M.	$900 million	Construction from summer 2014 to early 2015	Aquatics/ Wetland RSA	TransCanada PipeLines Ltd. website: http://www.transcanada.com/6215.html
6	Line 2 Replacement Project	Enbridge Edmonton Terminal to Joseph Lake	Enbridge Pipelines Inc.	Oil Pipeline	NEB approval granted on May 17, 2013	Proposed 38.2 km pipeline paralleling the alignment of the Edmonton to Hardisty Pipeline Project (above) from the Enbridge Edmonton Terminal at NE 32-52-23 W4M to a valve located near Joseph Lake at SW 1-50-22 W4M.	$ unknown	Construction from August 2013 to late 2013	Air Quality RSA Aquatics/ Wetland RSA Acoustic RSA Soil LSA Vegetation RSA Wildlife RSA	NEB website: https://www.neb-one.gc.ca/ll-eng/livelink.exe?func=ll&objId=893373&objAction=browse&sort=-name

TABLE 8A.1-1 Cont'd

7	Northern Gateway Project	Bruderheim, Alberta to Kitimat, BC	Northern Gateway Pipelines Limited Partnership	Oil and Condensate Pipeline	Under review (NEB application submitted May 2010)	Key components of the project include: • separate oil and condensate pipelines, each of about 1,172 km in length; • 10 pump stations; • all-weather road access and electrical power infrastructure for the pump stations and the Kitimat Terminal; • fourteen 496,000-barrel capacity tanks; • a utility berth; and • two marine loading and unloading berths. The project will generate approximately 62,694 person-years of employment during construction throughout the Canadian economy and 1,146 full-time jobs annually during operation.	$5.5 billion	Construction from 2014 to 2017	Aquatics/ Wetland RSA Grizzly Bear RSA	NEB website: https://www.neb-one.gc.ca/ll-eng/livelink.exe/fetch/2000/90464/90552/384192/620327/customview.html?func=ll&objId=620327&objAction=browse Northern Gateway Project website: http://www.northerngateway.ca/ Enbridge Northern Gateway Project Joint Review Panel website: http://gatewaypanel.review-examen.gc.ca/clf-nsi/hm-eng.html
8	Polaris Expansion Project – Edmonton Extension	Lamont to Sherwood Park	Inter Pipeline Inc.	Diluent Pipeline	Proposed	Installation of approximately 50 km of NPS 24 diluent pipeline and facilities from certain Edmonton area diluent receipt points to the Polaris Lamont Pump Station. The new pipeline will provide 111,290 m^3/d (700,000 bbl/d) of diluent supply capacity to the Lamont Station.	$80 million	Construction from 2013 to 2016	Air Quality RSA Aquatics/ Wetland RSA Acoustic RSA Wildlife RSA	Inter Pipeline Inc. website: http://www.interpipelinefund.com/operations/new-projects.cfm
9	Quest Carbon Capture and Storage Project	Thorhild to approximately 5 km northeast of Fort Saskatchewan	Shell Canada Ltd.	Carbon Capture and Storage Project	ERCB approval granted on July 10, 2012	The proposed development entails: construction of facilities for the capture of 1.2 megatonnes of CO_2 per year at the existing Shell Scotford Upgrader at 12-32-55-21 W4M; an 80 km pipeline to transport dense-phase CO_2 from the Scotford Upgrader to the sequestration site located north of the County of Thorhild at 15-29-60-21 W4M; and three to eight CO_2 injection wells connected to the main pipeline by laterals, each of which would be less than 15 km long.	$1.35 billion	Construction from late 2012 to 2015	Aquatics/ Wetland RSA	ERCB Decision: http://www.ercb.ca/decisions/2012/2012-ABERCB-008.pdf Shell website: http://www.shell.ca/en/aboutshell/our-business-tpkg/business-in-canada/upstream/oil-sands/quest.html
10	Western Reach Pipeline System	Gordondale to Fort Saskatchewan	Plains Midstream Canada ULC	Gas Pipelines	Pre-application (in early planning stages)	A proposed dual 570 km pipeline system originating in the Gordondale area to meet the transportation and processing demands of producers drilling in the Deep Basin.	$900 million	In-service by late 2015	Aquatics/ Wetland RSA	Plains Midstream Canada ULC website: http://www.plainsmidstream.com/content/open-season-proposed-new-western-reach-ngl-pipeline-system
11	Woodland Pipeline Extension Project	Fort McMurray to Sherwood Park	Enbridge Pipelines (Woodlands) Inc.	Oil Pipeline	ERCB approval granted on August 30, 2012	Construction and operation of two pump stations and a pipeline that would transport diluted bitumen from Enbridge Pipelines (Athabasca) Inc.'s existing Cheecham Terminal, located 7-8-84-6 W4M at Fort McMurray, Alberta to Enbridge Pipelines Inc.'s existing Edmonton Terminal, located at 5-4-53-23 W4M at Sherwood Park, Alberta.	$ unknown	Construction start in 2013, with operation scheduled for 2015	Air Quality RSA Aquatics/ Wetland RSA Acoustic RSA Wildlife RSA	ERCB Decision: http://www.ercb.ca/decisions/2012/2012-ABERCB-009.pdf Enbridge website: http://www.enbridge.com/WoodlandPipelineExtensionProject/ProjectOverview.aspx
Proposed Transmission Line Developments										
12	Eastern Alberta Transmission Line Project	Northeast Edmonton area to Brooks area	ATCO Electric Ltd.	Overhead Transmission Line	AUB approval granted on November15, 2012	A new transmission line between the Gibbons-Redwater area northeast of Edmonton and the Brooks area southeast of Calgary. The new line will be built and operated as a 500 kilovolt (kV) high voltage direct current line and run approximately 500 km in length.	$1.65 billion	Currently under construction, in-service by late 2014	Aquatics/ Wetland RSA	AUC website: http://www.auc.ab.ca/items-of-interest/eastern-alberta-transmission-line/Pages/default.aspx ATCO Electric Ltd. website: http://hvdc.atcoelectric.com/
13	Heartland Transmission Project	Edmonton Area	EPCOR Distribution and Transmission and AltaLink Management Ltd.	Overhead Transmission Line	AUB approval granted on November 1, 2011	Involves the construction of an overhead double circuit 500 kV transmission line, which will connect to the Heartland Substation (northwest of Fort Saskatchewan) to the Ellerslie Substation.	$582 million	Currently under construction, in-service by fall 2013	Air Quality RSA Aquatics/ Wetland RSA Acoustic RSA Soil LSA Vegetation RSA Wildlife RSA	AUC website: http://www.auc.ab.ca/items-of-interest/heartland-transmission-project/Pages/default.aspx Heartland Transmission Project website: http://www.heartlandtransmission.ca/update/index.asp
14	Western Alberta Transmission Line Project	Genesee area to Langdon area	AltaLink Management Ltd.	Overhead Transmission Line	AUB approval granted on December 6, 2012	A new transmission line between the Genesee area west of Edmonton to Langdon area east of Calgary. The new line will be built and operated as a 500 kV high voltage direct current line.	$ unknown	Currently under construction, in-service by spring 2015	Aquatics/ Wetland RSA	AUC website: http://www.auc.ab.ca/items-of-interest/western-alberta-transmission-line/Pages/default.aspx AltaLink Management Ltd. website: http://www.altalink.ca/projects/centralabtransmission/watl/watl-project.cfm

Additional Proposed Developments										
15	Parkland Airport (Phase 1)	Approximately 15 km east of Spruce Grove	Parkland Airport Development Corp.	Airport	Proposed	The proposed Parkland Airport will consist of two phases. Phase 1 will consist of an east–west runway with basic aviation services, hangars and offices. The potential Phase 2 (2015+) development would consist of a north–south runway to enhance the airport's operation in all wind conditions.	$35 million	Construction of Phase 1 from 2013 to 2014 and Phase 2 in 2015 or later	Air Quality RSA Aquatics/ Wetland RSA Acoustic RSA Soil LSA Vegetation RSA Wildlife RSA	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx Parkland Airport Development Corp website: http://www.parklandairport.com/
16	Robb Trend Project	Approximately 40 km southeast of Hinton	Coal Valley Resources Inc.	Coal Mine	Under review (Environmental Impact Assessment [EIA] submitted to ERCB in April 2012)	The proposed Robb Trend Project is a proposed extension to the existing mining and coal processing activities at Coal Valley Mine, approximately 40 km southeast of Hinton. The development is located adjacent to existing mining operations, and will yield approximately 88.75 million clean metric tonnes available for sale. This additional tonnage would provide Coal Valley Resources Inc. with the necessary resources to operate at projected rates of production until 2038.	$ unknown	Construction and operation will occur in stages, with construction of Stages 1A and 1B from late 2013 to 2017 and initial operations anticipated to commence in late 2014	Aquatics/ Wetland RSA Grizzly Bear RSA	Alberta Environment and Sustainable Resource Development website: http://environment.alberta.ca/02313.html
17	Vista Coal Mine Project	Approximately 10 km east of Hinton	Coalspur Mines Ltd.	Coal Mine	Under review (EIA submitted to ERCB in May 2012)	The proposed mine will develop 5 million clean tonnes per year of moderately low-rank bituminous, suited for thermal electric generation. The proposed mine is approximately 10 km east of Hinton town boundary and extends southeast for approximately 12 km to the McLeod River valley. The proposed Vista Coal Mine Project will involve: • a surface coal mine including pits, external waste rock dumps, a full range of surface coal mining and support equipment and infrastructure; • associated infrastructure including raw and clean coal conveyors, crushers and sizers, a coal processing plant and drying facilities, fresh water storage pond, fines settling pond and clean-coal load-out facility. The load-out facility loads coal into rail cars on a siding that will be constructed, owned and operated by CN Rail; • access corridors, haul roads, utilities and environmental management systems for a 20-year mining area. Projected labour requirements include approximately 700 person-years of construction and approximately 510 full time positions during operation.	$ unknown	Construction will occur in stages, expected to start in 2014 and initial operations anticipated to commence in 2015	Air Quality RSA Aquatics/ Wetland RSA Acoustic RSA Vegetation RSA Wildlife RSA Grizzly Bear RSA	Alberta Environment and Sustainable Resource Development website: http://environment.alberta.ca/02313.html Coalspur Mines Ltd. website: http://www.coalspur.com/
HARGREAVES TO DARFIELD SEGMENT										
Proposed Hydroelectric Developments										
1	Castle Creek Hydropower Project	Approximately 30 km south of McBride	Castle Mountain Hydro Ltd.	Run-of-River Hydroelectric Project	Investigative use permit issued by BC MFLNRO on October 8, 2012	Proposed 8 MW hydropower project on Benjamin Creek located in the McBride area.	$20 million	In-service by November 2016	Aquatics/ Wetland RSA Wildlife RSA	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf Northern Development Initiative Trust website: http://investnorthcentralbc.ca/major-projects-investment-opportunities/map-view/robson-valley/castle-mountain-run-of-river-projects BC MFLNRO Investigative Use Application and Reasons for Decision (file #7408639): http://www.arfd.gov.bc.ca/ApplicationPosting/viewpost.jsp?PostID=8003 BC MFLNRO Investigative Use Application: http://arfd.gov.bc.ca/ApplicationPosting/viewpost.jsp?PostID=19649 BC Hydro website: http://www.bchydro.com/energy-in-bc/acquiring_power/closed_offerings/clean_power_call/outcome.html

TABLE 8A.1-5

REASONABLY FORESEEABLE DEVELOPMENTS IN ALBERTA (UNMAPPED)

Project	Location/Proponent	Description	Status and/or Schedule	Sources
PUBLIC, TOURISM, ARTS AND OUTDOOR RECREATION DEVELOPMENTS				
Calder, Capilano and Stanley Milner Libraries ($38.5 million)	Edmonton/City of Edmonton	Proposed development consists of construction of the new Calder Library and Capilano Library and the rehabilitation of the Milner Library.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Clareview Multi-Purpose Facility ($93 million)	Edmonton/City of Edmonton	Development of outdoor natural grass and artificial turf sports fields, park spaces and a multi-purpose recreation centre, as well as a high school completion centre and the Clareview Library.	Under construction/completion in 2014.	City of Edmonton Website: http://www.edmonton.ca/city_government/projects_redevelopment/clareview-district-park-development.aspx
Downtown Performing Arts Centre ($850 million)	Edmonton/Edmonton Academic and Cultural Foundation	Proposed development includes a performing arts centre including open air arts galleria, 1,600-seat theatre and three smaller spaces, underground parking garage and office tower.	Proposed/construction from 2014 to 2017.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Edmonton Area and Entertainment District Development Project ($604.5 million)	Edmonton/City of Edmonton and Edmonton Arena Corp.	The proposed project includes a new arena to house the Edmonton Oilers, Winter Garden, community rink, LRT connection and pedestrian corridor.	Proposed/construction start in early 2014, in-service by September 2016.	City of Edmonton Website: http://www.edmonton.ca/city_government/projects_redevelopment/downtown-arena.aspx
Edmonton Police Service Northwest Campus ($65 million)	Edmonton/City of Edmonton and Edmonton Police Service	Proposed Northwest Campus would include a police station, arrest processing unit and training facility.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Edmonton Valley Zoo Developments ($50 million)	Edmonton/City of Edmonton	Proposed development consists of several phases of development including a main public pathway to the new exhibit areas as they develop and an interactive play and education area.	Under construction/unknown.	City of Edmonton Website: http://www.edmonton.ca/city_government/projects_redevelopment/downtown-arena.aspx
Edson Health Care Centre ($186.4 million)	Edson/Alberta Health Services and Alberta Infrastructure	The proposed new Edson Health Care Centre will include: an emergency department; acute care; outpatient services; renal dialysis unit; surgical services; primary health care services; diagnostic imaging and laboratory services; physician clinic space; and continuing care.	Under construction/completion in 2015.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx Alberta Health Services website: http://www.albertahealthservices.ca/2342.asp
Emerald Hills Aquatic and Wellness Centre ($25.8 million)	Sherwood Park/Strathcona County	Proposed new aquatic and wellness centre.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Federal Building Parkade and Centennial Plaza ($110 million)	Edmonton/Alberta Infrastructure	Renewal of the Federal Building and construction of a new public plaza and parkade to increase public space at the Legislature grounds and provide year round recreational opportunities for visitors.	Under construction/completion in late 2013.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx Alberta Infrastructure Website: http://www.infrastructure.alberta.ca/5.htm

TABLE 8A.1-5 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Fort Edmonton Park Expansion ($110 million)	Edmonton/Fort Edmonton Park Management Co.	Proposed expansion of Fort Edmonton Park.	Proposed/construction anticipated to take between 7 and 10 years.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Glenrose Long Term Care Facility ($51.4 million)	Edmonton/Alberta Infrastructure and Alberta Health and Wellness	Proposed development of a long-term care and transition and continuing care facility.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Hinton Training Centre Additions/Alterations ($39.1 million)	Hinton/Alberta Infrastructure and Alberta Environment and Sustainable Resource Development	Proposed additions and alterations to the Hinton Training Centre.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Meadows Recreation Centre and Library ($88.8 million)	Edmonton/City of Edmonton	New recreation centre and library.	Under construction/completion in 2014.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
NAIT Centre for Applied Technologies ($200 million)	Edmonton/NAIT	New centre for applied technologies.	Proposed/construction start in 2013/2014 with several years to complete.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx NAIT Website: http://www.nait.ca/44779_90969.htm
NorQuest College North Learning Centre (Downtown Campus) Development ($170 million)	Edmonton/NorQuest College	The learning centre is planned as a 27,500 m2, five-storey building facing Capital Boulevard, flanked by 103 Avenue and 107 Street.	Proposed/unknown.	NorQuest College Website: http://www.norquest.ca/media-centre/news/2011/norquest-s-downtown-campus-development-project-and.aspx Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Royal Alberta Museum ($340 million)	Edmonton/Government of Alberta	A new provincial museum anticipated to be an iconic institution respected around the world.	Under construction/completion in 2016.	Alberta Infrastructure: http://www.infrastructure.alberta.ca/5.htm
Stollery Children's Hospital Renovations ($33.7 million)	Edmonton/Alberta Infrastructure	Development consists of a surgical suite redevelopment and IMRI renovations.	Under construction/completion in 2015.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Strathcona Hospital Phase 1 ($130 million)	Sherwood Park/Alberta Infrastructure	Construction of Strathcona Hospital Phase 1. Phase 2 cancelled in 2013 provincial budget.	Under construction/completion in 2014.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
The Quarters Hotel ($45 million)	Edmonton/Shivam Developments	Proposed new hotel.	Proposed/completion in 2014.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Trestle Creek Golf Resort ($30 million)	East of Entwistle/Trestle Creek Golf Resort	Development consists of an RV resort, recreation centre, equine centre, sports park and 27 hole golf course.	Under construction/first 9 holes completed in 2012, second nine to be completed in 2014.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
University of Alberta Dentistry/Pharmacy Building Repurposing ($170 million)	Edmonton/University of Alberta	Proposed dentistry/pharmacy building repurposing and refurbishment.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx

TABLE 8A.1-5 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
University of Alberta Student Physical Activity and Wellness Centre ($57 million)	Edmonton/University of Alberta	Development of a new student physical activities and wellness centre.	Under construction/construction from 2012 to 2014.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
University of Alberta Student Residence Buildings A and B in East Campus ($27 million)	Edmonton/University of Alberta	Proposed development of student residence buildings in the East Campus Village.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
University of Alberta St. Joseph's College Women's Residence ($28 million)	Edmonton/University of Alberta	Proposed development of a new women's residential building.	Proposed/construction from 2013 to 2015.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Visual Performing Arts Centre ($90 million)	Edmonton/Grant MacEwan University	Proposed new visual performing arts centre at the MacEwan University Downtown Campus.	Proposed/construction from 2013 to 2015.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
TRANSPORTATION AND INFRASTRUCTURE				
Bethel Transit Terminal and Park and Ride ($23 million)	Sherwood Park/Strathcona County	The new development will be located at the current site of Strathcona Station and Park and Ride on Bethel Drive. The new transit terminal will be an integrated terminal and park and ride lot that will eventually anchor intermunicipal transit service between Strathcona County and Edmonton.	Under construction/completion in late 2013.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx Strathcona County Website: http://www.strathcona.ca/departments/Transit/Bethel-Terminal-Background.aspx
Campbell Road Transit Centre/Park and Ride ($30 million)	St. Albert/City of St. Albert	Proposed Campbell Road transit centre and park and ride.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Central Station LRT Rehabilitation and Jasper Avenue Streetscaping ($44 million)	Edmonton/City of Edmonton	Development includes repairs to the Central LRT Station and the development of a new streetscape along a section of Jasper Avenue between 100 and 102 Street.	Under construction/completion in December 2013.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx City of Edmonton Website: http://www.edmonton.ca/transportation/road_projects/central-lrt-station-jasper-avenue-streetscape.aspx
Highway 22 Bridge Construction and Highway Realignment ($51 million)	Drayton Valley/Alberta Transportation	Development entails bridge replacement over the North Saskatchewan River, highway realignment and grade revisions, access management and intersection relocation/improvements.	Under construction/completion in 2014.	Alberta Transportation Website: http://www.transportation.alberta.ca/projects/index.html
LRT Bridge Replacement of Cloverdale Pedestrian Bridge ($45 to $65 million)	Edmonton/City of Edmonton	A proposed LRT bridge to replace Cloverdale pedestrian bridge on Downtown – Millwoods Line.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx

TABLE 8A.1-5 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
North LRT to NAIT (Metro Line) ($755 million)	Edmonton/City of Edmonton	The North LRT to NAIT (Metro Line) is a 3.3 km extension from Churchill LRT Station in downtown Edmonton northwest to NAIT. It is the first segment of a planned LRT expansion to Edmonton city limits near St. Albert and is part of the Transportation Master Plan's vision to expand LRT service to all sectors of the City by 2040.	Under construction/completion in December 2013.	City of Edmonton Website: http://www.edmonton.ca/transportation/ets/lrt_projects/downtown-to-nait-lrt-study.aspx
Northeast Anthony Henday Project ($1.81 billion)	Edmonton/City of Edmonton	The Northeast Anthony Henday Project will include 18 km of reconstructed six and eight-lane divided freeway, 9 km of new six and eight-lane divided freeway, nine service interchanges, seven grade separations and twin river bridge structures. The 27 km northeast leg of the ring road will be free-flow (there will be no traffic lights on the freeway).	Under construction/construction from 2012 to 2016.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx Northeast Anthony Henday Project website: http://www.northeastanthonyhenday.com/index.php
Northeast Transit Garage ($ 130 million)	Edmonton/City of Edmonton	Replacement of the Westwood Transit Garage with the Northeast Transit Garage.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx
Southeast to West LRT (Valley Line) Project ($3.2 billion)	Edmonton/City of Edmonton	A proposed 27 km low-floor urban line that will run from Mill Woods to Lewis Farms, crossing through downtown Edmonton. The project is currently in the preliminary design phase.	City Council approval/construction could start in 2015 and take several years.	City of Edmonton Website: http://www.edmonton.ca/transportation/ets/lrt_projects/southeast-to-west-lrt-mill-woods-to-lewis-farms.aspx
Queen Elizabeth II (QE II) Highway and 41 Avenue SW Interchange ($205 million)	Edmonton/City of Edmonton	Proposed activities include construction on a grade-separated interchange in south Edmonton, at the junction of QE II Highway and 41 Avenue SW. This partial cloverleaf interchange will convert 41 Avenue SW into a continuous corridor with full access to and from QE II Highway. Further, a new bridge will be constructed over Blackmud Creek on the realigned section of 41 Avenue SW. The project will also include a road/rail grade separation of the Canadian Pacific Railway tracks east of QE II Highway.	Approved/construction from summer 2013 to 2015.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx City of Edmonton Website: http://www.edmonton.ca/transportation/road_projects/qe-2-hwy-41-avenue-interchange.aspx
UTILITY AND PUBLIC WORKS ACTIVITIES				
Urban Pipelines Replacements Project ($600 to $700 million)	Edmonton/ATCO Gas and Pipelines Ltd.	Proposed construction of new high-pressure natural gas pipeline network in the Transportation Utility Corridors of Edmonton and Calgary over a period of five years.	Proposed/unknown.	Alberta Inventory of Major Projects: https://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx ATCO Gas and Pipelines Ltd. Website: http://www.atcopipelines.com/upr/ AUC Website: http://www.auc.ab.ca/items-of-interest/urban-pipeline-replacement/Pages/default.aspx

TABLE 8A.1-5 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
OIL AND GAS EXPLORATION AND DEVELOPMENT				
Edmonton Terminal (South) Expansion Project	Edmonton/Enbridge Pipelines Inc.	Proposed construction and operation of several new tanks and associated facilities at the existing Enbridge Edmonton Terminal at NW 32-52-23 W4M, with transfer pipe via NE 32-52-23 W4M that integrates the new tanks into the existing terminal in SE 5-53-23 W4M.	NEB approval granted on July 25, 2013 (Order XO-E101-017-2013) and pre-clearing activities commenced in fall 2013 with operations to begin in the first half of 2015.	NEB Website: https://www.neb-one.gc.ca/ll-eng/livelink.exe?func=ll&objId=919196&objAction=browse&sort=-name
Edmonton Terminal Expansion Project	Edmonton/Trans Mountain Pipeline ULC.	Trans Mountain is currently in the process of constructing the Edmonton Terminal Expansion Project, which involves constructing 10 new tanks and associated facilities at the Edmonton Terminal. This project was approved by the NEB in March 2008 and is now being constructed under Amending Order AO-005-XO-T246-04-2008. In February 2013, Trans Mountain applied to the NEB to vary Amending Order AO-005-XO-T246-04-2008 to permit construction of four additional tanks at the Edmonton Terminal for a total of 14 tanks. The NEB issued an Amending Order AO-006-XO-T246-04-2008 on June 20, 2013 and the four additional tanks are expected to come into service by late 2014.	Under construction/all tanks in-service by late 2014.	NEB Website: https://www.neb-one.gc.ca/ll-eng/livelink.exe?func=ll&objId=474966&objAction=browse&sort=-name
Natural Gas to Liquid Fuel Plant ($8 billion)	Edmonton/Sasol Canada Holdings Ltd.	Proposed gas-to-liquid conversion facility. The development would create more than 500 new, permanent skilled jobs once in operation and employ over 5,000 other individuals during peak construction periods.	In planning stages/in-service by late 2015.	Alberta Inventory of Major Projects: http://www.albertacanada.com/business/statistics/inventory-of-major-projects.aspx Sasol Canada Holdings Ltd. Website: http://www.sasolcanada.com/our-canadian-business/canada-gtl-project/

TABLE 8A.1-6

REASONABLY FORESEEABLE DEVELOPMENTS IN BC (UNMAPPED)

Project	Location/Proponent	Description	Status and/or Schedule	Sources
PUBLIC, TOURISM, ARTS AND RECREATION DEVELOPMENT AND ACTIVITIES				
Acadia Road Primary and Intermediate School ($29 million)	Vancouver/School District 39	Replacement of existing University Hill Secondary school with new a 1,030 student capacity K-8 school.	Under construction/February 2012 to January 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
BC Children's and Women's Hospital Expansion ($682 million)	Vancouver/Provincial Health Services Authority	Redevelopment of the BC Children's and Women's Hospital to create a state of the art facility for pediatric care and research.	Under construction/spring 2011 to fall 2018.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Bike Lane Master Plan ($25 million)	Vancouver/City of Vancouver	Proposed investment in 55 km of new bike lanes for Vancouver's Cycling Master Plan.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Burke Mountain Secondary School ($64 million)	Coquitlam/School District 43	Proposed new school with a capacity for 1,200 students.	Proposed/November 2013 to August 2016.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Casino, Hotel and Convention Centre ($100 million)	Surrey/unknown	A proposed 200-room hotel and 800-seat convention centre with casino is planned for a 10 ha site at 8th Avenue and 168th Street.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Centennial Secondary School ($62 million)	Coquitlam	Proposed replacement of the 1,250 student school.	Proposed/February 2013 to April 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Chilliwack Senior Secondary Replacement ($58 million)	Chilliwack	Replacement of the secondary school on the existing site for 1,200 student capacity and a Neighbourhood Learning Centre.	Construction started/January2011 to fall 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Chip and Shannon Wilson School of Design - Kwantlen University College ($36 million)	Richmond/Kwantlen University College	Proposed 4,900m^2 facility for a technical apparel design program.	Proposed/fall 2013 to March 2016.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Dalai Lama Educational Centre ($60 million)	Vancouver/unknown	Proposed development for a 2,790 m^2 educational centre.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
False Creek Elementary School ($20 million)	Vancouver/School District 93	A new Conseil Scolaire Francophone elementary school to be located in the False Creek neighbourhood.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Great Northern Way Campus Expansion ($134 million)	Burnaby	Expansion of the Great Northern Way Campus, including construction of a state-of-the-art Emily Carr visual, media and design art facility that would accommodate up to 1,800 students.	Construction started/June 2011 to July 2016.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Guildford Recreation Centre Complex Expansion ($41 million)	Surrey/City of Surrey	A new 52.5 m long swimming pool building will be added in a planned expansion of the Guildford Recreation Centre complex.	Proposed/2013 to 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Hemlock Valley Mountain Ski Resort Expansion ($ unknown)	Agassiz	Proposed expansion to include additional lifts and ski runs as well as a new village centre, several 35 to 65 room hotels and up to 5,000 housing units.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf Company Website: www.hemlockvalleyresort.com

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Heritage Mountain Middle School ($28 million)	Coquitlam	New 500 student capacity junior middle school.	Under construction/August 2012 to April 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
International Village Elementary School ($23 million)	Vancouver/School District 39	Proposed new elementary school located in the International Village neighbourhood.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
John Oliver Secondary ($45 million)	Vancouver School District 39	Renovation and seismic upgrade of the school.	Proposed/June 2013 to September 2016.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
John Robson Elementary School ($23 million)	New Westminster/School District 40	Replacement of elementary school with 380-student capacity on a new site.	Proposed/spring 2013 to September 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Kitsilano Secondary School Replacement ($58 million)	Vancouver/School District 39	Proposed replacement of the school at 2550 W. 10th Ave with an 18,000 m^2, 3-storey facility.	Proposed/March 2013 to August 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Lord Strathcona Community Elementary School ($30 million)	Vancouver/School District 39	Seismic upgrade to elementary school is in planning stages.	Proposed/August 2013 to December 2016.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Lions Gate Hospital Acute Mental Health Facility - Hope Centre ($62 million)	North Vancouver/Vancouver Coastal Health Authority and Lions Gate Hospital Foundation	Development of a 4 storey, 26-bed psychiatric services building.	Under construction/fall 2012 to summer 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Mission Community Health Centre ($31 million)	Mission	Proposed 2,510 m^2 health complex located near Mission General Hospital will include primary care, public health, clinics and a senior`s campus of care.	Under construction/July 2012 to late 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Moody Middle School Replacement ($23 million)	Coquitlam	Replacement of Moody Middle School with a capacity for 450 students.	Proposed/April 2013 to December 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
New Westminster Secondary School (82 million)	New Westminster/School District 40	Proposed new secondary school to replace the existing 1,800-student capacity school.	Proposed/July 2013 to September 2016.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Pacific National Exhibition (PNE) Expansion ($208 million)	Vancouver/City of Vancouver	Proposed redevelopment plan of the Hastings Park that would see Playland expanded ($36.5M) and pulled back from Hastings St. Improvements to auditoriums ($40.6M) and parking expansion ($32M).	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Pitt River Middle School Replacement ($20 million)	Coquitlam	Replacement of the 450 capacity middle school.	Under construction/February 2012 to July 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Royal Inland Hospital - Clinical Services Building, Parking and Site Infrastructure Upgrading ($80 million)	Kamloops/Interior Health Authority	Proposal to upgrade hospital site infrastructure and construct a multi-storey parkade and clinical building.	Proposed/late 2013 to unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Simon Fraser University Student Union Building and Stadium (SFU) ($65 million)	Burnaby	Proposed 9,290 m^2 student union building and 2,500 seat outdoor stadium.	Proposed/spring 2013 to September 2017.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf SFU Website: http://buildsfu.sfss.ca/
South Surrey Recreational Amenities ($51 million)	Surrey/City of Surrey	Construction of a new 50 m swimming pool, a new fitness facility and an addition for community arts.	Proposed/2012 to 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Surrey City Hall and Civic Facility ($97 million)	Surrey/City of Surrey	New city hall to be located in the Whalley area. A performing arts centre, office building, additional space for SFU and mixed use building will be included in the planned facility on 102 Avenue.	Under construction/summer 2012 to 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Surrey Memorial Hospital Emergency Department and Critical Care Tower ($512 million)	Surrey/Surrey Memorial Hospital	Construction is underway on a new emergency department and critical care tower at the Surrey Memorial Hospital as well as renovation and expansion of existing space.	Under construction/March 2011 to summer 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Thompson River University - Faculty of Law Building ($20 million)	Kamloops/Thompson Rivers University	Expansion to the Faculty of Law at Thompson Rivers University.	Under construction/fall 2012 to September 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
UBC Student Union Building ($120 million)	Vancouver/UBC	Proposed Student Union Building.	Proposed/complete by August 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Quintet Mixed Use Development ($ 1 billion)	Richmond/Canada Sunrise Development Corp.	A 5 tower development including a community centre and a campus for Trinity Western University, located on Minoru Boulevard.	Under construction/summer 2011 to 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Vancouver Art Gallery ($350 million)	Vancouver/Vancouver Art Gallery	Proposed relocation of the Vancouver Art Gallery.	Proposed/2013 to 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Vancouver Aquarium Revitalization and Expansion Project ($100 million)	Vancouver/Vancouver Aquarium	The revitalization and expansion will include 8 projects approved in August 2010.	Under construction/fall 2011 to 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Vancouver General Hospital - Joseph and Rosalie Segal Family Centre ($85 million)	Vancouver/Vancouver General Hospital	Planned replacement of the aging psychiatric facility at Vancouver General Hospital.	Proposed/2014 to 2017.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Whitecaps Stadium - Thunderbird Park ($33 million)	Vancouver/Vancouver Whitecaps FC	Proposed National Soccer Development Centre will be built at UBC Thunderbird Park.	Proposed/spring 2013 to 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Willoughby Elementary School ($20 million)	Langley	Proposed new elementary school for the Willoughby neighbourhood.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Willoughby Middle School ($20 million)	Langley	Proposed new middle school for the Willoughby neighbourhood.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Yorkson Area Middle School ($23 million)	Langley	Middle School will accommodate 750 students from grades 6 to 8 and include a Neighbourhood Learning Centre.	Proposed/early 2013 to September 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
TRANSPORTATION AND INFRASTRUCTURE DEVELOPMENT				
Abbotsford Airport Expansion ($100 million)	Abbotsford/City of Abbotsford	Expansion for the Abbotsford airport that will include a 1,300 m^2 passenger terminal, runway upgrades. A hotel and tourist-related services are also part of the plan. The $30 million runway expansion portion of the project was completed in September 2011. Approximately 81 ha will be designated for future aerospace related developments.	Under construction/2010 to 2020.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf Abbotsford International Airport Backgrounder Report: http://www.abbotsford.ca/Assets/Abbotsford/News+Releases/2011-09-16+Abbotsford+Airport+Expansion+Backgrounder.pdf
Brooksbank Avenue Underpass/ Lynn Creek Rail Bridge ($46 million)	North Vancouver/Port Metro Vancouver	Modifications to Brooksbank Avenue underpass ($25M) for future port and terminal expansion have completed construction. The Lynn Creek Rail Bridge addition ($21M) is expected to complete in spring 2014.	Under construction/July 2010 to spring 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Burrard Street Bridge Improvements ($63 million)	Vancouver/City of Vancouver	Proposed renovation of the Burrard Street Bridge.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Deltaport Terminal Road and Rail Improvement Project ($280 million)	Delta/PMV, Province of BC and TSI Terminal Systems Inc.	The project has four key elements: an overpass on the existing Roberts Bank causeway that will separate road and rail traffic; reconfiguration of rail track and additional container handling equipment within the existing Deltaport Terminal; additional rail track within the existing railway corridor and a portion of the Option Lands; and road improvements on Deltaport Way.	Under construction/late 2012 to late 2014.	PMV Website: http://portmetrovancouver.com/en/projects/ongoingprojects/DTRRIP/Environment.aspx
Gateway Program – North Fraser Perimeter Road ($72 million)	Coquitlam to Pitt Meadows/BC MTI	Route to improve trucking and vehicle route along an extended United Boulevard through Coquitlam along Highway 7 to the north end of the Golden Ears Bridge.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Gateway Program – North Fraser Perimeter Road, New Westminster Section ($60 million)	New Westminster/BC MTI	Route to provide improved trucking and vehicle route along the north end of the Queensborough Bridge along Front, Columbia and Brunette in New Westminster.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Gateway Program - Port Mann Bridge/Highway 1 Improvements ($3.3 billion)	Langley To Vancouver/BC MTI	Construction is underway on a new 10-lane bridge across the Fraser River between Coquitlam and Surrey, 37 km of highway widening from Vancouver to Langley, including 30 km of new high occupancy vehicle lanes, and the replacement of nine highway interchanges.	Under construction/February 2009 to late 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf Port Mann Bridge/Hwy 1 Improvements Website: http://www.pmh1project.com/Pages/default.aspx

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Gateway Program - South Fraser Perimeter Road ($1,264 million)	Surrey to Delta/BC MTI and Fraser Transportation Group Partnership	A 40 km long four-lane, 80 km/hr route along the south side of the Fraser River from Deltaport Way in southwest Delta to 176th Street (Highway 15) in Surrey, with connections to Highways 1, 15, 17, 91, 99, and TransLink.	Under construction/fall 2008 to December 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf Fraser Transportation Group Partnership Website: http://www.sfprconstruction.ca/index.php
Highway 1 Truck Lane - 232 Street to 264 Street ($24 million)	Langley	An eastbound truck climbing lane will be added to Highway 1 between 232 Street and 264 Street and the 248th Street overpass will be replaced.	Proposed/2013 to spring 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Highway 99 Interchange - 16th Avenue ($24 million)	Surrey/BC MTI	A new interchange on Highway 99 will replace the 16th Avenue overpass.	Proposed/2013 to 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Hope to Kawkawa Lake Road Bridge Replacement ($6.6 million)	Hope/Jakes Construction Ltd.	Replacement of the Kawkawa Lake Road Bridge from a timber bridge to a two vehicular-lane concrete bridge with one dedicated pedestrian path and two 1.5 m shoulders. The project will also include an upgrade of approximately 200 m of Kawkawa Lake Road.	Under construction/complete by summer 2013.	Jakes Construction Website: http://www.jakesconstruction.ca/2013/02/15/suckers-creek-bridge-replacement-kawkawa-lake-road-improvements/ CEA Agency Website: http://www.acee-ceaa.gc.ca/052/details-eng.cfm?pid=51930 BC MTI News Release: http://www2.news.gov.bc.ca/news_releases_2005-2009/2009TRAN0016-000252.htm
Low Level Road Realignment ($100 million)	North Vancouver/TransLink	Realignment of Lower Level Road over 1.5 km to accommodate 2 new tracks and the North Shore Spirit Trail.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Mission Bridge Seismic Upgrade ($21 million)	Mission/BC MTI	Phased upgrade of the Mission Bridge.	Under construction/October 2010 to late 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Neptune/Cargill Grade Separation ($48 million)	North Vancouver/PMV	Project to improve rail movements near Lower Level Road and 3rd Street East.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Old Port Mann Bridge Demolition ($50 million)	Coquitlam and Surrey/Transportation Investment Corporation	Demolition and removal of the superstructure, substructure, piers, and footings of the old Port Mann Bridge down to the Fraser River mudline.	Demolition started/completion by late 2014.	Port Metro Vancouver Website: http://portmetrovancouver.com/en/projects/OngoingProjects/Tenant-Led_Projects/PortMannDemo.aspx
Pemberton Ave Grade Separation ($43 million)	North Vancouver/District of North Vancouver	Proposed overpass over the CN Rail line replacing the Pemberton Avenue and Philip Avenue crossings.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Port of Vancouver - South Shore Corridor Project ($75 million)	Vancouver/Vancouver Fraser Port Authority	The project includes road improvements on port lands between Heatley Avenue and McGill Street in Vancouver.	Under construction/complete by 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Powell Street Grade Separation ($48 million)	Vancouver/Port Metro Vancouver	Proposed grade separation located between the Clark Drive and Heatley Avenue entrances to the PMV terminals.	Proposed/complete by March 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Roberts Bank Rail Corridor – Grade Separation and Improvements ($307 million)	Delta, Surrey and Langley/TransLink	Grade separation and rail improvements at nine sites in the Lower Mainland.	Under construction/spring 2011 to 2018.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Shortsea Shipping Route ($26 million)	Vancouver/Transport Canada	Proposed development of specialized multimodal facilities for a Shortsea shipping route will consist of seven projects.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Skytrain - Evergreen Line Rapid Transit Project ($1.4 billion)	Vancouver to Coquitlam/BC MTI and TransLink	A new rapid transit line that will connect Coquitlam to Vancouver via Port Moody and Burnaby.	Under construction/complete by summer 2016.	Major Project Inventory http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf BC EAO Website: http://a100.gov.bc.ca/appsdata/epic/html/deploy/epic_project_home_348.html Evergreen Line Website: http://www.evergreenline.gov.bc.ca/index.htm
Skytrain - Expo Line Upgrade Strategy ($3.1 billion)	Surrey and Vancouver Area/BC MTI and TransLink	Double the capacity of the existing Expo Line and add a proposed 6 km SkyTrain extension in Surrey to Fleetwood Area.	Under construction/2008 to 2020.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/September_2012.pdf TransLink Website: http://www.translink.ca/en/Plans-and-Projects/Rapid-Transit-Projects/Expo-Line-Upgrade-Strategy.aspx
Stewart Street Elevated Structure ($80 million)	Vancouver/Port Metro Vancouver	Proposed elevated structure to accommodate through traffic will be located east of Clark Drive near Vanterm.	Proposed/complete by March 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Trans Canada Hwy Improvements - Hoffman's Bluff ($42 million)	Kamloops/BC MTI	Proposed improvements to re-align and widen 3.1 km of the Trans Canada Highway through Hoffman's Bluff to four lanes.	Proposed/2013 to fall 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Trans Canada Hwy Improvements – Monte Creek to Pritchard ($49 million)	Kamloops/BC MTI	Widening to four lanes of Highway 1 between Monte Creek and Pritchard.	Proposed/October 2011 to fall 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Trans Canada Hwy Improvements - Pritchard to Hoffman's Bluff ($20 million)	Kamloops/BC MTI	Proposed improvements to widen 3 km of the Trans Canada Hwy from Pritchard to Hoffman's Bluff to four lanes.	Proposed/spring 2013 to fall 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Vancouver International Airport Upgrades ($1.74 billion)	Richmond/Vancouver Airport Authority	Upgrades include: 700 m of corridors, moving walkways and a high-speed baggage system for the international terminal ($408M); and upgrades to the domestic terminal ($488.7M). Airfield improvements ($286.4M) will include runway safety enhancements and upgrades to roads, bridges and dykes ($559.8M).	Proposed/completed by 2022.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Vancouver International Airport Expansion ($1.76 billion)	Richmond/Vancouver Airport Authority	Expansion Plan 2010 includes several phases, many of which are completed. New proposal for continued airport development in Expansion Plan 2027 includes an additional terminal (by 2015) and runway (by 2023) and 14 additional gates and options are being reviewed for an additional runway at the estimated capital cost of $1 billion (not included in capital cost shown).	Under construction/April 2000 to 2027.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Western Lower Level Route Extension to Marine Drive ($87 million)	North Vancouver/BC MTI	Project to extend Lower Level Route from Garden Avenue to Marine Drive to include a bridge over the Capilano River.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
UTILITY, PUBLIC WORKS AND ALTERNATIVE ENERGY DEVELOPMENT				
Berkey Creek Hydroelectric Project ($ unknown)	Hope/Princeton Energy Inc.	Proposed 1.5 MW hydroelectric project on Berkey Creek, approximately 10 km southeast of Hope.	Proposed/unknown.	BC MFLNRO Investigative Use Application and Reasons for Decision: http://arfd.gov.bc.ca/ApplicationPosting/viewpost.jsp?PostID=3883
Big Bend Substation ($32 million)	South Burnaby/BC Hydro	The South Burnaby, Big Bend area requires a new greenfield, 100 MVA, 69/12 kV substation to meet local residential and commercial load growth.	Proposed/spring 2013 to spring 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf BC Hydro Website: http://www.bchydro.com/energy-in-bc/projects/substation/bigbend.html
Biomass Heating Project ($27 million)	Vancouver/UBC	Proposed biomass project located at the University of British Columbia.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Burnaby - New Westminster Area Reinforcement ($31 million)	New Westminster/BC Hydro	A new 60 kV underground transmission circuit and upgrading the New Westminster Substation.	Under construction/spring 2012 to fall 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Cache Creek Landfill Extension ($100 million)	Cache Creek/Belkorp Environmental Services	Proposed extension of the existing Cache Creek landfill to provide an additional 15 million tonnes of capacity.	Proposed/spring 2013 to 2017.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Capilano Substation Upgrade ($45 million)	North Vancouver/BC Hydro	Project will add a new building, 25 kV and 60 kV indoor switchgear and two 75 MVA 60/25 kV transformers to raise the capacity to 100 MVA at Capilano Substation.	Proposed/complete by fall 2016.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Capilano (Cleveland) Dam Powerplant ($90 million)	North Vancouver/Greater Vancouver Regional District	Proposed 14 MW plant built in the Capilano watershed would include turbines and generators to produce power for approximately 6,000 homes.	Proposed/complete by 2020.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Clemina Creek Hydroelectric Project ($27 million)	Valemount/TransAlta Corp.	11 MW hydroelectric run-of-river project located on the Clemina Creek south of Valemount.	Under Review (not confirmed)/start date unknown, in-service by July 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf BC Hydro Generator Interconnection Queue shows as under review. Website: http://www.jtst.gov.bc.ca/economic_pilots/barriere_mcbride_info.htm#projects
Coquitlam Area Reinforcement ($21 million)	Coquitlam/BC Hydro	Add a 150 MVA 230 25 kV transformer and a 100 MVA feeder section at Como Lake substation which serves the community of Coquitlam.	Under construction/spring 2012 to spring 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Esme Creek Hydroelectric Project ($ unknown)	Hope/Innergex Renewable Energy Inc.	Proposed 9.3 MW hydroelectric project on Esme Creek, approximately 45 km northwest of Hope.	Proposed/unknown.	BC MFLNRO Investigative Use Application and Reasons for Decision: http://www.arfd.gov.bc.ca/ApplicationPosting/viewpost.jsp?PostID=9080
Eureka Creek Hydroelectric Project ($ unknown)	Hope/Princeton Energy Inc.	Proposed 1.35 MW hydroelectric project on Eureka Creek, approximately 3 km south of Hope.	Proposed/unknown.	BC MFLNRO Investigative Use Application and Reasons for Decision: http://arfd.gov.bc.ca/ApplicationPosting/viewpost.jsp?PostID=4169
Iona Island Wastewater Treatment Plant Upgrades ($1 billion)	Richmond/Greater Vancouver Regional District	Proposed upgrades to Iona Island wastewater treatment plant.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Kamloops Sewage Treatment Centre Upgrade ($43 million)	Kamloops/City of Kamloops	The upgrade will result in the improvement of effluent quality for discharge into the Thompson River. In addition, the upgrade will replace the aging infrastructure, improve energy efficiency and recover resources.	Under construction/April 2012 to February 2014 .	Canada Economic Action Plan Projects Map: http://actionplan.gc.ca/en/page/projects-map City of Kamloops News Release: http://www.kamloops.ca/news/2012/04-20-SewageTreatmentCentre.shtml Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Kidd 2 Substation Upgrade Project ($34 million)	Richmond/BC Hydro	Replace aging equipment and increase the capacity of the Kidd 2 Substation to meet the growing demand for electricity in the Richmond area.	Under construction/fall 2011 to fall 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf BC Hydro Website: http://www.bchydro.com/energy-in-bc/projects/substation/kidd2.html

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Lions Gate Sewage Treatment Plant ($400 million)	North Vancouver/City of North Vancouver	Proposed construction of a new secondary sewage treatment plant near Burrard Inlet on the former BC Rail passenger station at McKeen Avenue and West First Street to replace the existing Lions Gate Primary Treatment plant at the north end of the Lions Gate Bridge.	Proposed/complete by 2020.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Lynn Valley Substation Upgrade - Phase 1 ($21 million)	North Vancouver/BC Hydro	The project involves adding an indoor 25 kV feeder section and a 150 MVA 230/25 kV transformer to increase station capacity.	Proposed/early 2011 to fall 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
McBride Biomass Project ($140 million)	McBride/EcoTECH Energy Group	Project to include a combined heat and electricity generating station. Phase 1 will produce a total of 7 MW of power and will be followed by phase 2 planned for 24 MW. Phase 3 is in the planning stages. Rezoning and permitting are in place and establishment of temporary housing for workers is underway.	Proposed/spring 2013 to 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf Northern Development Initiative Trust Website: http://investnorthcentralbc.ca/major-projects-investment-opportunities/map-view/mcbride-2/green-technology-industrial-park
Merritt Green Energy Project ($120 million)	Merritt/Western Bioenergy Inc.	Proposed 40 MW biomass energy project requiring provincial and BC Hydro approvals.	Proposed/complete by early 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf BC Hydro Interconnection Queue: http://transmission.bchydro.com/NR/rdonlyres/20779185-8EEC-4622-9B6A-0AF4DD50E642/0/TGIQueue2013Apr22.pdf
Metro Vancouver Waste-to-Energy Incineration Facility ($500 million)	Vancouver/Metro Vancouver	Approval issued; however, proposed waste-to-energy incinerator is dependent on solid waste management plan.	Proposed/unknown.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Nicola 500 kV Station Reconfiguration ($15 million)	Merritt/BC Hydro	The project scope includes a 500 kV transmission line position rearrangement within the substation, bus conductor upgrade and transformer high-side breaker installation.	Under construction/spring 2012 to fall 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Northwest Stave River Hydroelectric Project ($41 million)	Mission/Innergex Renewable Energy Inc.	Proposed 18 MW run-of-river hydroelectric project located 45 km northwest of Mission.	Under construction/fall 2011 to late 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Organic Biofuel Facility ($68 million)	Surrey/City of Surrey	Organic biofuel facility located near the Port Kells Transfer Station. 80,000 metric tonnes/year of organic waste will be converted into compressed natural gas.	Proposed/start date unknown, completion in 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Ruskin Dam Safety and Powerhouse Upgrade ($718 million)	Mission/BC Hydro	Seismic and other upgrades required to Ruskin Dam	Construction from 2012 to 2018.	BC Hydro Website: http://www.bchydro.com/energy-in-bc/projects/ruskin_dam_powerhouse_upgrade.html BCUC Decision: http://www.bcuc.com/Documents/Decisions/2012/DOC_30241_03-30-2012_C-5-12_BCH_Ruskin-Dam-Decision-WEB.pdf

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
Serpentine Creek Hydroelectric Project ($22 million)	Blue River/TransAlta Corp.	9.6 MW run-of-river hydro project on Serpentine Creek located near Blue River.	Under Review (not confirmed)/start date unknown, in-service by July 2014.	BC Hydro Generator Interconnection Queue shows as under review. Website: http://transmission.bchydro.com/NR/rdonlyres/20779185-8EEC-4622-9B6A-0AF4DD50E642/0/TGIQueue2013Apr22.pdf BC Ministry of JTST Regional Economic Investment Pilot website indicates still undeveloped. http://www.jtst.gov.bc.ca/economic_pilots/barriere_mcbride_info.htm#projects
Seymour Arm Series (Capacitor Station 5L71/5L72 Project) ($55 million)	Chase/BC Hydro	Construct a 500 kV series capacitor station adjacent to the existing transmission lines 5L71 and 5L72, which run between Mica Generating Station and the Nicola Substation near Merritt.	Under construction/fall 2011 to fall 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Seymour-Capilano Filtration Project ($600 million)	North Vancouver/Metro Vancouver	Water filtration plant. Construction of pumping station completed in late 2008 and filtration plant in spring 2010. Commissioning of twin 7.1 km long tunnels is expected in 2014.	Construction from 2003 to 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Silverdale Substation Project ($37 million)	Mission/BC Hydro	A new substation to serve the growing demand for electricity in the Mission area.	Under construction/early 2012 to fall 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf BC Hydro Website: http://www.bchydro.com/energy-in-bc/projects/substation/silverdale.html
Surrey Area Substation Project ($67 million)	Lower Mainland/BC Hydro	Construction of facilities necessary to reinforce the transmission system in the Fraser Valley West Area.	Proposed/Complete fall 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Surrey Waste-to-Energy Incineration Facility ($ unknown)	Surrey/City of Surrey	Proposed waste-to-energy plant to be located near Surrey town centre.	Proposed/complete by 2015.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Telus Data Centre ($100 million)	Kamloops/Telus Communications Corp.	Flagship data centre to accommodate 200 workers.	Under construction/fall 2012 to summer 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Tributary to Wardle Creek Hydroelectric Project ($ unknown)	Hope/Princeton Energy Inc.	Proposed 0.61 MW hydroelectric project on a tributary to Wardle Creek, approximately 5 km southeast of Hope.	Proposed/unknown.	BC MFLNRO Investigative Use Application and Reasons for Decision: http://arfd.gov.bc.ca/ApplicationPosting/viewpost.jsp?PostID=4159
Vancouver City Central Transmission Project ($180 million)	Vancouver/BC Hydro	Build an enclosed 230/12 kV substation in the Mount Pleasant area of Vancouver and two new underground 230 kV transmission lines connecting the new substation to the existing transmission network to serve growing loads in the Mount Pleasant/False Creek area and maintain a reliable supply of electricity to other areas of Vancouver.	Under construction/November 2010 to early 2014.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf BC Hydro Website: http://www.bchydro.com/energy-in-bc/projects/vcct.html

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
MARINE AND INDUSTRIAL DEVELOPMENT				
Coal Handling Infrastructure Upgrade and Expansion ($120 million)	North Vancouver/Neptune Bulk Terminals Ltd.	Upgrade and expansion of metallurgical coal handling systems at a terminal to increase throughput and improve coal handling operations. The increased vessel traffic from the project is expected to be approximately one additional train per day and one additional vessel per week.	Under construction/January 2013 to November 2014.	Permit Application: http://portmetrovancouver.com/Libraries/PROJECTS_Project_Review/2012-06-01_Application_fr_Neptune_-_Neptune_-_Coal_Handling_Infrastructure_Improvements__Project_Allison__PP_2012-066.sflb.ashx Permit Approval: http://portmetrovancouver.com/Libraries/PROJECTS_Project_Review/2013-01-23_Project_Permit_-_Signed_with_Plans_and_Schedule_-_Neptune_Coal_Capacity_PP_2012-066.sflb.ashx
Fraser Surrey Docks Direct Transfer Coal Facility (unknown)	Surrey/Fraser Surrey Docks	Proposed development of a Direct Transfer Coal Facility at the southwest end of the existing terminal to handle up to four million metric tonnes of coal per year. The coal will be transferred by rail to the terminal and will be loaded onto barges at existing Berth 2. When loaded, tugs will take single barges down to the mouth of the Fraser River. Once barges pass Sand Heads, they will be towed in tandem to Texada Island. From there the coal will be stored before transfer to a deep sea vessel for overseas export.	Under review/construction from Q1 to Q4 2014.	Port Metro Vancouver Website: http://portmetrovancouver.com/en/projects/OngoingProjects/Tenant-Led_Projects/FraserSurreyDocks.aspx
Maple Ridge Industrial Park ($250 million)	Maple Ridge/Steve Pelton	Proposal for 81 ha of land on 203rd Street in Maple Ridge would include an industrial park, 2 ha of community garden, park space, trails and community amenities.	Under construction/construction started in fall 2012.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
Richardson International Grain Storage Capacity ($105 million)	North Vancouver/Richardson International Ltd.	The proposal includes installation of approximately 494 open-ended steel wall piles and 315 timber piles, and construction of two 40,000 metric tonne concrete storage annexes.	Under construction/in-service by early 2015.	Port Metro Vancouver Website: http://www.portmetrovancouver.com/en/projects/OngoingProjects/Tenant-Led_Projects/RichardsonInternational.aspx
Roberts Bank Terminal 2 Expansion Project ($2 billion)	Delta/PMV	The Roberts Bank Terminal 2 Project is a proposed new multi-berth container terminal at Roberts Bank in Delta, B.C. that would provide 2.4 million TEUs (twenty-foot equivalent unit containers) of container capacity. The project is part of Port Metro Vancouver's Container Capacity Improvement Program, a long-term strategy to deliver projects to meet anticipated growth in demand for container capacity to 2030.	Pre-application/ construction from 2017/2018 to 2024.	Roberts Bank Project Website: http://www.robertsbankterminal2.com/
Seaspan Shipyard Modernization ($62 million)	North Vancouver (Burrard Inlet)/Seaspan ULC	Proposed works under PMV's permit review process include Construction of a 53.56 m long x 31.8 m wide concrete load-out pier and installation of approximately 102 steel piles.	Under construction/in-service by early 2015.	Port Metro Vancouver Website: http://portmetrovancouver.com/en/projects/OngoingProjects/Tenant-Led_Projects/Seaspan.aspx

TABLE 8A.1-6 Cont'd

Project	Location/Proponent	Description	Status and/or Schedule	Sources
South Richmond Terminal Project ($ unknown)	Richmond/Lehigh Hanson Materials Ltd.	Proposed development of an aggregate (sand and gravel) processing and distribution facility on leased property owned by Port Metro Vancouver in southeast Richmond. Components include a wash plant, aggregate material stockpiles, reclaimer, rail and truck loading facilities and two marine berths for loading and unloading barges. Several years of site preparation will be required to achieve the necessary ground settlement across the site prior to construction of the facility, which is expected to begin in 2018.	Under review/construction from 2014 to 2022.	Port Metro Vancouver Website: http://www.portmetrovancouver.com/en/projects/OngoingProjects/Tenant-Led_Projects/LehighHansonSouthRichmondTerminalProject.aspx
Vancouver Shipyard Improvements ($200 million)	North Vancouver (Burrard Inlet)/Seaspan ULC	Improvements to the Vancouver shipyard include a fabrication shop, assembly hall, workshops, offices and equipment required to build large vessels.	Under construction/November 2012 to October 2014.	Seaspan Marine Corp. Website: http://www.seaspan.com/shipyards/modernization.php
MINERAL RESOURCES				
Highland Valley Copper Modernization ($475 million)	Logan Lake/Teck Resources Ltd.	Modernization to extend the life of the mill and increase the mill capacity.	Under construction/summer 2012 to late 2013.	Major Project Inventory: http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf
PROPOSED PIPELINE DEVELOPMENTS				
Vancouver Airport Fuel Delivery Project ($100 million)	Richmond to Vancouver/Vancouver Airport Fuel Facilities Corp.	Proposed marine terminal expansion in Richmond along the South Arm of the Fraser, a fuel receiving and storage facility near the marine terminal and a new jet fuel delivery pipeline to YVR. Application currently under review by the BC EAO.	BC EAO application approval is pending/estimated 24 month construction period following approval.	Major Project Inventory http://www.jtst.gov.bc.ca/ministry/major_projects_inventory/pdfs/December_2012.pdf BC EAO Website: http://a100.gov.bc.ca/appsdata/epic/html/deploy/epic_project_home_346.html Fuel Delivery Project Website: http://www.vancouverairportfuel.ca/home

9.0 SUPPLEMENTAL STUDIES

9.1 Introduction

A comprehensive environmental field program was conducted in 2012 and 2013 in support of the ESA to address the following objectives:

- characterize the environmental setting of the Project (including physical and meteorological environment, soil and soil productivity, water quality and quantity, air emissions, GHG emissions, acoustic environment, fish and fish habitat, wetlands, vegetation, wildlife and wildlife habitat and species at risk);
- identify sensitive or unique features;
- support the selection and refinement of a proposed pipeline corridor;
- develop environmental mitigation measures to avoid or reduce potential effects; and
- assess the potential residual environmental effects (including the Project's contribution to residual cumulative effects) that might be caused by or otherwise affect the Project.

The environmental field program was designed to support the highest standards of environmental assessment in recognition of the large scale of the Project and the many ecosystems the Project crosses.

Co-operation was received from many Aboriginal communities, landowners and regulatory authorities, resulting in access to most lands and facilities along the proposed pipeline corridor for the environmental field crews. This allowed for the collection of field data which complemented desktop studies, literature reviews, information available from 60 years of operational experience, adjacent lands, and professional judgment.

Access was not available at some land parcels at the time of field study; however, potential effects and mitigation measures were developed based on existing literature and desktop studies and knowledge of adjacent lands as well as the professional judgment of the assessment team. Additional field studies will be completed in 2014 for lands where access was not available in order to confirm literature results and mitigation measures, including those found in the EPPs. Additional field studies may also be warranted if route refinement results in new lands being crossed.

All applicable permits that may be necessary will be identified prior to commencing supplemental field investigations. The EPPs (Volumes 6B, 6C and 6D), Environmental Alignment Sheets (Volume 6E) and Environmental Facility Drawings (Volumes 6C and 6D) will be updated and re-issued prior to construction with pertinent information on site-specific issues and mitigation measures arising from the supplemental (ongoing) studies. Current mitigation, management and contingency plans have been developed to address potential findings from the ongoing studies and have been based on existing literature as well as professional judgment based on continuity of adjoining land parcels for which comprehensive field studies have been completed. The proposed mitigation measures are anticipated to be sufficient to address potential adverse effects from the Project.

No supplemental studies relating to the following elements are anticipated:

- physical and meteorological environment;
- water quality and quantity;
- air emissions;
- GHG emissions;
- acoustic environment;

- marine sediment and water quality;
- marine fish and fish habitat;
- marine mammals; and
- marine birds.

Although no specific surveys for the species at risk element are anticipated, the field work and supplemental filings for fish and fish habitat, vegetation and wildlife and wildlife habitat will include information regarding species at risk for each of those elements.

The objectives of the supplemental filings are to confirm predictions and gather site-specific information for the implementation of mitigation measures and EPPs.

Soils, archaeology and terrestrial ecosystem mapping (TEM) field investigations will be completed in Finn Creek Provincial Park, North Thompson Provincial Park, Lac Du Bois Grasslands Protected Area, Coquihalla Summit Recreation Area and Bridal Veil Falls Provincial Park as the Research and Education Park Use Permit was issued by the BC Ministry of Environment on November 15, 2013. Application for this permit was submitted to BC Parks in December 2012 and further updated in June 2013. This permit allows for ground disturbance in the provincial parks. Other field surveys that did not warrant any ground disturbance have already been completed.

The additional data for soil and soil productivity, fish and fish habitat, wetlands, vegetation and wildlife and wildlife habitat will be collected in spring/summer 2014 to confirm predictions and proposed mitigation measures. Results of the supplemental studies, along with an update to the biophysical assessment (including results of updated TEM-based habitat models) will be submitted to the NEB in Q3 2014.

9.2 Soil and Soil Productivity

9.2.1 Location of Survey

Exact locations of additional test holes will be determined in Q1 2014 after field results from Q3 and Q4 2013 are processed.

9.2.2 Survey Methodology

All field surveys in 2014 will be consistent with those detailed in the Soils Technical Report in Volume 5C.

9.2.2.1 Qualifications of Personnel Designing and Conducting the Survey

The soils assessment methods for the Project, outlined in the Soils Technical Report (Volume 5C) were developed by Al Twardy (senior soils scientist at Mentiga) who has over 40 years of field and office experience. The soils survey for areas where land access was not available will be conducted by qualified soil scientists under the direction of Al Twardy, the owner and senior consultant at Mentiga.

9.2.2.2 Consultation with Applicable Government Agencies

Additional regulatory consultation is not anticipated because there will be no change to the baseline soil and soil productivity survey methods previously employed. If an alteration to the soil method approach is warranted, appropriate regulatory authorities will be consulted and details of any additional consultation will also be submitted to the NEB.

9.3 Fish and Fish Habitat

Field programs in 2012 and 2013 focused on the assessment of potential fish habitat traversed by the proposed pipeline corridor in both Alberta and BC, where private and Crown land access was permitted. Sites for pump stations and power lines were also assessed for potential fish habitat in BC. No pump stations or ancillary facilities encroached upon watercourses in Alberta, so assessments were completed in association with the proposed pipeline corridor of the Edmonton to Hinton Segment only. Access to proposed crossings occurring on private land or in Aboriginal traditional territory was not granted for minor areas along the Fish and Fish Habitat LSA, which precluded habitat assessments.

Watercourses with previously documented fish information and sufficient existing habitat related data were assigned a fish-bearing classification and sensitivity ranking. However, field investigations at these fish-bearing watercourses will be completed to collect detailed habitat information, photos and to document fish presence within the Fish and Fish Habitat LSA. In the absence of field data from 2012 and 2013, and any available historical information, watercourses have been assigned an interim classification until fish presence/absence and habitat potential can be confirmed. Interim classifications included the use of data collected adjacent to the proposed pipeline corridor, where access was available, the watercourse gradient or presence of other barriers downstream and the overall size of the potential watercourse. Where unsure, a default “fish-bearing status” was assigned.

At approximately 11 watercourses in BC, private land access, timing constraints and sampling restrictions in provincial parks limited multiple seasons of sampling. Watercourses with low fish habitat potential retained a nonfish-bearing designation when no fish were captured or observed through one season of sampling and the habitat value was considered to be low or nil. Watercourses were assigned a fish-bearing status when no fish were captured or observed, habitat was rated moderate or higher and there were no obvious barriers to fish migration. The potential for fish within these watercourses near the proposed pipeline corridor is likely low, but a second season of sampling will be conducted to confirm the absence of fish presence as per sampling requirements for BC in the specific cases mentioned.

If the potential watercourses not yet investigated are determined to be watercourses (*i.e.*, have defined bed and banks), the applicable Environmental Monitoring Sheet(s) from the technical report will be revised to reflect the updated information. The Environmental Alignment Sheets will be updated to include the new crossing details.

A re-examination of the Project’s federal notification and authorization requirements, as related to construction activities with the potential to affect fish and fish habitat, will also be needed. It is expected that a MOU between the NEB and DFO will be released prior to the end of 2013. Once this MOU (and relevant review process tools) is interpreted with the Project’s activities in context, appropriate notification and authorization requirements will be identified.

9.3.1 Location of Survey

A total of 47 of 836 potential crossings (including power line crossings) were not assessed during the 2012 and/or 2013 field program, while additional sampling will be conducted at 18 watercourses to confirm habitat potential and use for some of the indicator species over part or the entire Fish and Fish Habitat LSA, or to collect habitat data or photo documentation of the crossing site. Exact locations and timing of surveys will be determined in Q1 2014.

9.3.2 Survey Methodology

The methods for the fish and fish habitat surveys will be consistent with those detailed in the Fisheries (Alberta) Technical Report and Fisheries (British Columbia) Technical Report in Volume 5C.

9.3.2.1 Qualifications of Personnel Designing the Survey

The fisheries assessment methods for the Project, outlined in the Fisheries (Alberta) Technical Report and Fisheries (British Columbia) Technical Report (Volume 5C) were developed collectively by TERA’s Aquatics Discipline, GeoMarine and Triton, and will continue to be used.

9.3.2.2 Qualifications of Personnel Conducting the Survey

The 2014 fisheries surveys will be conducted by TERA and Triton staff in Alberta and BC, respectively. Where feasible, the same Field Crew Lead(s) and member(s) that conducted the 2012/2013 field program for the proposed pipeline corridor will conduct the 2014 fisheries surveys. In the event that the aforementioned field personnel are not available to conduct the survey, a suitable alternate(s) with similar qualifications will be supplied by TERA and/or Triton.

9.3.2.3 Consultation with Applicable Government Agencies

Baseline survey methods for the 2012 open water aquatic assessments were discussed with federal authorities (DFO) in September 2012 and 2013, and provincial regulatory authorities (*e.g.*, AESRD, BC MFLNRO) throughout spring/summer 2012 and 2013.

9.4 Wetlands

Detailed wetland information along the proposed pipeline corridor has been collected through overflights as well as field reconnaissance. The purpose of the 2014 ground-based wetland surveys will be to confirm baseline wetland information derived from literature reviews and professional knowledge for the various wetlands crossed by the proposed pipeline corridor and associated power lines. The results of the 2014 wetland surveys will confirm wetland information in Sections 7.0 and 8.0, as well as wetlands mitigation in the EPPs and the Environmental Alignment Sheets.

9.4.1 Location of Survey

Wetland surveys were conducted for the proposed pipeline corridor in 2012 and 2013. Additional wetland surveys will be conducted in spring/summer 2014 at locations where access was not granted during the 2012 and 2013 field seasons to confirm predictions and proposed mitigation measures.

9.4.2 Survey Methodology

Wetlands will be classified according to the Canadian Wetland Classification System (NWWG 1997) in Alberta and Mackenzie and Moran's Wetlands of British Columbia: A Guide to Identification (Mackenzie and Moran 2004) in BC. The methodology outlined in the Wetland Evaluation Technical Report (Volume 5C) will be used for any additional wetland surveys and will be conducted by qualified wetland specialists.

9.4.2.1 Qualifications of Personnel Designing and Conducting the Survey

The wetland field program has been designed and will be conducted by qualified wetland ecologists under the guidance of a senior wetland ecologist and Registered Professional Biologist that have over 15 years of experience designing and implementing wetland studies, and planning and designing mitigation for development projects.

In the event that the aforementioned field personnel are not available to conduct the survey, a suitable alternate(s) with similar qualifications will be supplied.

9.4.2.2 Consultation with Appropriate Regulatory Authorities

Consultation with federal and provincial regulatory authorities is ongoing. A summary of consultation with government and regulatory authorities that has occurred to date can be found in Section 2.0 of the Wetland Evaluation Technical Report (Volume 5C). Detailed information on consultation with additional stakeholders can also be found in the Wetland Evaluation Technical Report.

9.5 Vegetation

9.5.1 Vegetation and Rare Plants

Vegetation studies planned for 2014 will focus on acquiring additional data to support and confirm potential effects on vegetation.

The 2014 rare plant surveys will gather data for site-specific environmental protection planning for areas where access was not available during the 2013 field season. The data will be used to refine and augment the Rare Ecological Community and Rare Plant Population Management Plan provided in Volumes 6B and 6C.

The 2014 rare plant surveys will confirm mitigation measures for site-specific rare plants, lichens, and ecological communities as well as mitigation identified in the Vegetation Technical Report of Volume 5C, the EPPs of Volumes 6B and 6C, and on the Environmental Alignment Sheets of Volume 6E.

9.5.1.1 Location of Survey

Additional vegetation surveys will be conducted in 2014 at locations where access was not available during the 2013 field season to confirm predictions and proposed mitigation measures. The locations to be chosen for additional rare plant survey will be large areas or areas important from a vegetation perspective, where access was not granted or where Project details have been revised (*e.g.*, reroutes). They will be refined further prior to and during 2014 field work.

9.5.1.2 Survey Methodology

The rare plant survey methodology is based on the guidelines described in the ANPC *Guidelines for Rare Plant Surveys in Alberta* (ANPC 2012) and the BC CDC and E-Flora BC *Protocols for Rare Plant Surveys* (Penny and Klinkenberg 2012), and is provided in the Vegetation Technical Report of Volume 5C. Specific information collected will include plant and lichen species, incidental weed observations, UTM coordinates and species distributions.

Qualifications of Personnel Designing the Survey

Vegetation and rare plant survey methods were developed by qualified botanists with substantial experience and are based on the ANPC *Guidelines for Rare Plant Surveys in Alberta* (ANPC 2012) and the BC CDC and E-Flora BC *Protocols for Rare Plant Surveys* (Penny and Klinkenberg 2012), in conjunction with methodologies described in the *Occupancy Survey Guidelines for Prairie Plant Species at Risk* (Henderson 2009).

Qualifications of Personnel Conducting the Survey

Each Field Crew Lead conducting the vegetation or rare plant surveys will be a TERA vegetation specialist with substantial experience in performing vegetation surveys. Botanists have a specific knowledge base in vegetation. Each crew member has completed post-secondary education (*e.g.*, B.Sc., Environmental Science, Plant Science, etc.) and/or obtained a professional designation (*e.g.*, Biologist in Training [B.I.T.] or P. Biol with the Alberta Society of Professional Biologists, etc.).

Consultation with Appropriate Regulatory Authorities

In advance of the 2014 vegetation surveys, the BC CDC and ACIMS will be contacted for possible updated information regarding rare plant, lichen and ecological community occurrences.

9.5.2 Terrestrial Ecosystem Mapping

TEM field surveys were conducted in fall 2013 in order to confirm and support predictions and proposed mitigation measures. The 2013 field surveys included the Edson to Hinton Segment and areas in the Coquihalla and the Lower Mainland Region of BC where access was not previously available. The TEM plots were planned to achieve Survey Level Intensity 5. The fall 2013 field surveys are considered supplemental since results were not available in time to be incorporated into the application but will be included in the supplemental reporting to be submitted to the NEB in 2014.

9.5.2.1 Location of Survey

The exact locations of the completed fall 2013 TEM field surveys will be available in the supplemental report to be submitted to the NEB in 2014.

9.5.2.2 Survey Methodology

The survey methods will follow the methods described in the TEM Report in Appendix C of the Vegetation Technical Report of Volume 5C.

Qualifications of Personnel Designing the Survey and Mapping

TERA vegetation personnel have substantial experience designing and applying TEM mapping methodology. TEM mapping methodology for the Project was developed according to the *Standard for Terrestrial Ecosystem Mapping in British Columbia* (Resources Inventory Committee 1998) and was applied to both the Alberta and BC portions of the Project. As per standard TEM projects, the ecosystem mapping was based on a hierarchical ecosystem classification framework, which includes natural subregion units and ecosystem units in Alberta, and BGC subzone variant units and ecosystem units in BC. The TEM survey methodology is based on the methods outlined in the *Field Manual for Describing Terrestrial Ecosystems, 2nd Edition* (BC MOFR and BC MOE 2010).

Consultation with Appropriate Regulatory Authorities

Representatives from the Government of BC, including ecologists from the Thompson-Okanagan Region, Omineca and NE Region and the Coastal Region were contacted in 2012 and 2013 to introduce the Project and discuss TEM survey methodologies. A summary of the responses received during this consultation program is provided in the TEM Report (Appendix C) of the Vegetation Technical Report of Volume 5C. No additional consultation is planned in relation to supplemental surveys.

9.6 Wildlife and Wildlife Habitat

Additional wildlife surveys are planned in 2014 for areas where access was not available in 2012 and 2013 to confirm predicted effects and proposed mitigation measures.

9.6.1 Location of Survey

Field surveys will be conducted within the Wildlife LSA. The supplemental field survey list will be revised in Q1 2014 prior to commencement of surveys in areas where land access was limited and route refinements have been proposed.

9.6.2 Survey Methodology

The 2014 field surveys will follow the methods provided in the Wildlife Technical Report of Volume 5C.

Habitat models will follow the methods provided in the Wildlife Modelling and Species Accounts Report (Volume 5C) and TEM will be prepared following the methods provided in the Vegetation Technical Report (Volume 5C).

9.6.2.1 Qualifications of Personnel Designing the Survey

The field surveys were designed by a team of qualified and experienced professional biologists. The same survey procedures used in 2013 will be used in 2014. The Wildlife Technical Lead for the Project has over 15 years of experience designing and implementing wildlife studies, and planning and designing mitigation for development projects.

In the event that the aforementioned personnel are not available, a suitable alternate(s) with similar qualifications will be supplied.

9.6.2.2 Qualifications of Personnel Conducting the Survey

The 2014 field surveys will be conducted by a team of qualified professional biologists, including biologists with local expertise.

9.6.2.3 Consultation with Appropriate Regulatory Authorities

In advance of the 2014 wildlife surveys, updated information on wildlife occurrence records will be requested from the BC CDC and AESRD. Provincial and federal regulatory authorities will be consulted, when needed, to confirm the proposed survey locations and protocols.

9.7 Update to the Biophysical Assessment

An update to Volume 5A ESA – Biophysical will be provided to the NEB in Q3 2014. The update will contain the following information:

- an update to the biophysical settings (Sections 5.0 and 6.0), confirmation of effects assessment (Section 7.0) and cumulative effects assessment (Section 8.0) based on the collection of additional field information as well as the results of ongoing engagement and consultation that will confirm predictions; and
- an update to the biophysical setting (Sections 5.0 and 6.0), effects assessment (Section 7.0) and cumulative effects assessment (Section 8.0) based on confirmation of selected route, including any proposed reroutes that are located outside of the studied proposed pipeline corridor that will confirm predictions.

10.0 FOLLOW-UP

Under the *CEA Act, 2012* and as described in the NEB *Filing Manual*, a follow-up program is defined as a program to verify the accuracy of the environmental assessment of a designated project, and to determine the effectiveness of any mitigation measures.

Based on Project knowledge and comprehensive field studies to date, the need for follow-up programs under the *CEA Act, 2012* have been identified for select wildlife species at risk. Trans Mountain plans to collect additional information in 2014 to inform and refine the mitigation strategies recommended in the Environmental Protection Plans.

11.0 CONCLUSION

This biophysical component of the Environmental and Socio-Economic Assessment (ESA) was completed in support of the proposed Trans Mountain Expansion Project (referred to as "TMEP" or "the Project"). The socio-economic component of the ESA is found in the companion Volume 5B.

Application is being made by Trans Mountain Pipeline ULC (Trans Mountain), a Canadian corporation with its head office located in Calgary, Alberta, pursuant to Section 52 of the *National Energy Board Act* (*NEB Act*) for the TMEP.

The proposed expansion will, in essence, comprise the following:

- Pipeline segments that complete a twinning (or "looping") of the pipeline in Alberta and BC with about 987 km of new buried pipeline.
- New and modified facilities, including pump stations and tanks.
- Three new berths at the Westridge Marine Terminal in Burnaby, BC, each capable of handling Aframax class vessels.

The Project will require a NEB CPCN pursuant to Section 52 of the *NEB Act*. In addition, according to the *Regulations Designating Physical Activities,* the Project is a designated project under the *Canadian Environmental Assessment Act, 2012* (*CEA Act, 2012*). The ESA considers the mandatory factors listed in Section 19(1) of the *CEA Act, 2012*, the factors listed in the NEB *Filing Manual* (NEB 2013a), and pertinent issues and concerns identified through consultation and engagement with Aboriginal communities, landowners, regulatory authorities, stakeholders and the general public.

In addition, the ESA addresses the NEB's *List of Issues* (July 29, 2013) for the Project (NEB 2013b) provided below. Issues 4 and 5 of this list specifically informed the ESA.

1. *The need for the proposed project.*
2. *The economic feasibility of the proposed project.*
3. *The potential commercial impacts of the proposed project.*
4. *The potential environmental and socio-economic effects of the proposed project, including any cumulative environmental effects that are likely to result from the project, including those required to be considered by the NEB's Filing Manual.*
5. *The potential environmental and socio-economic effects of marine shipping activities that would result from the proposed project, including the potential effects of accidents or malfunctions that may occur (addressed in Volume 8A).*
6. *The appropriateness of the general route and land requirements for the proposed project.*
7. *The suitability of the design of the proposed project.*
8. *The terms and conditions to be included in any approval the Board may issue.*
9. *Potential impacts of the project on Aboriginal interests.*
10. *Potential impacts of the project on landowners and land use.*
11. *Contingency planning for spills, accidents or malfunctions, during construction and operation of the project.*
12. *Safety and security during construction of the proposed project and operation of the project, including emergency response planning and third-party damage prevention.*

The Board does not intend to consider the environmental and socio-economic effects associated with upstream activities, the development of oil sands, or the downstream use of the oil transported by the pipeline.

The scope and methodology of the ESA is more fully described in Section 1.2 of this volume. In summary, the ESA includes a description of the following:

- the environmental and socio-economic setting;
- the predicted beneficial and adverse effects of the proposed Project on the socio-economic and biophysical environment over the life of the Project;
- the methods used for effects analysis, and the rationale for selecting the methods chosen;
- the proposed inspection, monitoring and mitigation measures; and
- the predicted significance of residual Project effects and residual cumulative effects.

The ESA was prepared by a team of highly qualified environmental professionals with element-specific expertise led by TERA Environmental Consultants (TERA). Team members included representatives from:

- BGC Engineering Inc. for geotechnical expertise;
- Mentiga Pedology Consultants Ltd. for soils expertise;
- Waterline Resources Inc. for groundwater expertise;
- Rowan Williams Davies and Irwin Inc. for air, GHG and noise expertise;
- GeoMarine Environmental Consultants Ltd. and Triton Environmental Consultants Ltd. for fisheries expertise;
- Stantec Consulting Ltd. for marine resources, marine birds and marine sediment and water quality expertise; and
- TERA for fisheries, surface water, wetland, vegetation and wildlife expertise.

Environmental elements potentially interacting with the Project include: physical and meteorological environment; soil and soil productivity; water quality and quantity; air emissions; GHG emissions; acoustic environment; fish and fish habitat; wetland loss or alteration; vegetation; wildlife and wildlife habitat; marine sediment and water quality; marine fish and fish habitat; marine mammals; marine birds; and species at risk. The description of the environmental setting (current state of the environment) within the Project area was compared against the Project description to assess potential environmental effects that might be caused by the Project. For this assessment, one or more indicators (often referred to as Valued Ecosystem Components) were selected to describe the present and predicted future condition of an element. One or more measurement endpoints (measurable parameters) were identified for each indicator to allow quantitative or qualitative measurement of potential Project effects.

The environmental issues identified through engagement with Aboriginal communities, and consultation with landowners, regulatory authorities, stakeholders and the general public, as well as through literature reviews, field studies and the professional experience of the assessment team, are consistent with other projects of this nature. Most of the associated potential effects on environmental indicators arising from construction of the Project can be readily mitigated by standard environmental mitigation measures common to pipeline projects in similar settings.

Most of the potential environmental residual effects that are of high probability of occurring during construction and operation of the Project are considered to be reversible in the short to long-term.

The environmental assessment concludes that the proposed pipeline and associated facilities (*e.g.*, pump stations, terminals, Westridge Marine Terminal) do not result in significant adverse residual environmental effects as defined in Section 7.1. Consequently, the identified residual effects of construction and operation of the Project on environmental indicators will be not significant for the pipeline and facilities component of the Project.

The Project may act cumulatively with existing activities and reasonably foreseeable developments in the vicinity of the Project including agriculture (*e.g.*, crop production and livestock grazing), forestry, recreational activities, transportation activities (*e.g.*, vehicle and rail traffic, road infrastructure and highway maintenance), utilities activities (*e.g.*, transmission lines and gas distribution lines), rural and urban residential and commercial development, and industrial, oil and gas, and mineral resources developments. Cumulative effects associated with the Project were evaluated conservatively using assumptions relevant to the element under consideration. Most of the Project's contribution to cumulative effects within the element-specific LSAs and RSAs that are likely to occur, are anticipated to be reversible in the short to long-term and are generally of low to medium magnitude. There are no situations that would result in a significant adverse cumulative environmental effect, as defined in Section 7.1 for the pipeline and facilities component of the Project.

The TMX Anchor Loop Project required construction through Jasper National Park in Alberta and Mount Robson Provincial Park in BC, both of which are part of the United Nations Environmental, Scientific and Cultural Organization Canadian Rocky Mountain Parks World Heritage Site. In recognition of this setting and through consultation with stakeholders and various regulatory authorities, Trans Mountain implemented a number of unique and innovative restoration measures at particularly sensitive areas, with the objective of restoring ecological integrity of these lands and watercourses. Following construction of the TMX Anchor Loop Project, Trans Mountain reported on the effectiveness of mitigation and restoration that was implemented during and following construction as outlined in the Environmental Protection Plan and Restoration Plan for the Project. Many of the successes identified during post-construction monitoring can be attributed to the implementation of those mitigation measures outlined in the plans. The mitigation measures were successful at achieving the desired end results and management objectives of Parks Canada (TERA 2013). The TMX Anchor Loop Project is viewed by many as a legacy project, and has achieved a level of success that has exceeded expectations in many areas. This project proved that an oil pipeline can be constructed, maintained and operated in a highly valued ecological and historical setting of international importance. Many of the approaches, plans and programs which were implemented on TMX Anchor Loop have been adapted and enhanced for the TMEP.

Project design and industry and regulatory standards anticipate and address most of the Project's potential effects on the environment. Routing of the proposed pipeline corridor to parallel existing linear disturbances for most of its length (89%) has reduced the potential effects associated with construction and operation of the Project. Mitigation measures have been developed to further reduce the potential adverse residual environmental effects. Implementation of the proposed mitigation measures will further reduce the adverse residual environmental effects associated with the construction and operation of the Project. Applicable proposed construction mitigation measures will form the basis of operation and maintenance procedures during the life of the Project.
